What do you mean?

> I think the 68020 more likely resembles a 386, and the 68030 between a 386DX
> and a 486SX. BTW - A 68000 / 010 could in theory be compared to a 386SX.

MMU and FPU support was not available in the 68K series until the 68020. A built-in MMU was added in the 68030. The 80386 processor also has a built-in MMU. So you cannot compare a 68000/10 to a 80386 unless you aren't going to use the MMU for anything. Same with the 68020 unless you have an external MMU.

Actually, I'd run the latest and greatest version of linux. It would run in 4MB and fly with 8MB.

That comparison list is terrible. The 386sx is a much more powerful chip than the 68000/68010/68020. The 386 has a MMU and can support an FPU externally. It also has a 32-bit address bus and internal cache. The 68000/68010 have no cache, no support for an MMU or FPU and 24-bit address busses. The 68020 has no MMU but supports external coprocessors. It also has a 32-bit address bus and internal cache. The 68030 has a MMU but no FPU. The 486DX has both. The 68040MC/EC are rough equivalents to the 486DX2. I have no knowledge of the 68060.

[snipped]

You are mixing processors with systems.

I disagree here. The 486DX has a built-in FPU, the 030 has not.
I'd say 030 sort of equals 486SX in terms of technical specs (not in performance)
>68040 = 486DX2/4

Depends on which 040. There are 040's with FPU and 040's without FPU, right?
>68060 = P75
What about the EC versions and such??? Any thoughts on this?

>
>From experience, that would seem about right but with the cleaner OS's
>(Atari/Amiga) and custom chips the Motorola based systems often perform
>much better then this list may suggest.

Agreed. I
've seen a 040 system outperform a Pentium II Xeon in DTP apps, hard disk recording, MIDI sequencing and FMB manipulation. Better system architecture and cleaner software on a cleaner OS even though its core is 16-bit can do wonderous things...

Then again, for pure processing power, it's a shame the 060 wasn't developed any further. Raw processing os probably better on the more recent Intels. But, as with computers, look at the years those processors were brought to market and at what price. Then compare to the Intel competition.

Hmmm although Microbilly claims it's impossible I once installed a full Win95 with all of its applets, drivers, featurews, bugs and everything on a 386SX at 16MHz with 30 megs of HDD space using on the fly, okay, eh I mean "during-coffee-break" data compression on the drive and even had 2 megs left for storage of user data files. But then again, all you had on it was

wordpad / write.... *grin*
But hey, it worked...

than
>the 68000/68010/68020. The 386 has a MMU and can support an FPU externally.

That really depends on how much value or priority you put on the various
components of the processor. A Motorola processor is usually known to have a
better bus efficiency, which, on low bandwidth systems such as 8MHz ISA,
would have benefitted
the system more if there were peripherals that actually used all of the
bandwidth of those ISA systems - very few did -> hence other features were
more important to cut down cost, but even more on higher bandwidth systems.

Apart from Unix flavors, there were no operating systems for the 386SX that
actually made use of the MMU. This is a system problem, not a processor
problem.

One more thing about 020 vs. 386SX. The 386SX had a 16-bit external bus and a MMU (it was after all a cut-down 386DX). The 020 a 32-bit external bus and no MMU but support for an external one 68851. They can really not be compared in that manner.

>It also has a 32-bit address bus and internal cache. The 68000/68010 have no

>cache, no support for an MMU or FPU and 24-bit address busses. The 68020 has

Agreed on that, except for the support. The 68010 supports the 68881 FPU from what I know, and other _systems_ with 68000's have been known to support an FPU as well (albeit using non-standard methods - but then... the Weitek coprocessors for 386's were non standard as well and required their own address space...)

And don't forget the RapidCad variety of 386's...

>no MMU but supports external coprocessors. It also has a 32-bit address bus
>and internal cache. The 68030 has a MMU but no FPU. The 486DX has both. The

68030 supports 68882, a 486SX is a 486DX without an FPU. 68030 also has an internal cache - yes, it's smaller but it can cope with a smaller cache because of better bus efficiency than the 486.

>68040MC/EC are rough equivalents to the 486DX2. I have no knowledge of the

I agree. There are also 040's that equal a 486DX.

>68060
I'd compare it to a Pentium-class processor, no matter which. Main difference between 060 and Pentium class is bus access I think, not features. I'm not sure, but I think the 060 has a 64-bit bus, but I my confuse it with a Pentium. Anyway, the two had the exact opposite principals of eachother.

Comparison is difficult because of the myriad of different Pentium processors available with different features and bus access systems. There's the P54C (plain Pentium) variety and MMX variety with extra instructions making systems cheaper without the need for dedicated custom chips. Then there was the Pro variety which featured branch prediction and such, mainly used on NT servers and better served true 32-bit operating systems (NOT Win95, 98 or Win32s, but NT and OS/2 or Unix only), then there was the Pentium II, a combo of MMX and Pro with added circuitry, DEC Alpha technology. And a pro version of that, the Xeon, as well as a cut-down version, the Celeron. Ofcourse, there's also AMD's K6 with an additional MMX-like 3D instruction set and greater bus efficiency and it needs less cooling. And Cyrix / IBM's varieties are 'round the corner as well.
>
>[snipped]

<<snipped>>

Okay so here's my comparison table starting at 286 (not below). It's a BASIC table which does not contain special combinations such as RapidCad, Cyrix 586, Weitek or ITT, or even 020+851 and such. Just BASICS. Yes I know it gets more complicated if you count in other factors and options of those processors. Only attempting to scale things in according to processing principles, the main value being buswidth and address space, then features.

80286 (1986)
68000 (1979)
68010
80386SX (after 386DX)
68020
80386DX (1990), 68030 (1987)

Just forget it I screwd up here :-) What I meant was that the 68K's could
access the rest of the system with greater success rates than Intels
processors in terms of clock ticks and overhead time and such.

Win95. And most people used Microsoft O.S.'s... All this makes the MMU issue
a secondary one, IMHO.

>MMU.
Well, the 386SX had a 16 bit external bus, the 020 a 32-bit one just like
the 386DX. Just because it has no built-in MMU doesn't mean it's not a
32-bit processor. I also believe they had the same address space (32-bit). I
agree on the 68000/010 mostly. I would probably place them somewhere in
between the 286 and the 386SX.

Exactly, YOU would, as would I. But then, I estimate that you are probably a
power user. Most common users are Wintel people. What you say of Linux will
also run fine on 68K, although I agree that for Linux, the MMU definately
becomes an issue, which would make the low-end processor on 68K probably a
030 or in emergencies a 020 with external 851. Although the built-in PMMU of
the 030 is a cut-down version of the 68851 used with the 020.

Didn't OS/2 run on the 386? And didn't Windows 3.1 use the MMU if you had one? I think it did because there are definately virtual memory settings in Windows 3.1.

> One more thing about 020 vs. 386SX. The 386SX had a 16-bit external bus and

Very true. MMUs are valuable, however, and I think that the 020 losses points for not having one.

There was no support for F-line instructions until the 020 so you had to hack
in support for external coprocessors. The 386 did provide a standard for
external coprocessors (though I don't remember how).

[snipped]

Your list skips the 68030/68040.

No it doesn't because I wouldn't use a MS OS on a 386 and we are talking
processors and not systems.

The 386 is also a 32-bit processor. The size of the bus does not matter in deciding the bitness.

Not to get into systems but PCs are definately the place to run linux. PC versions come first and are usually better tuned than their 68K/MIPs/Alpha/Sparc/ARM counterparts.

I was relating it more to actual performance, then technical specs.

> >68040 = 486DX2/4
>
> Depends on which 040. There are 040's with FPU and 040's without FPU,
right?
Yes, matched as closely as possible (with FPU/486DX, without FPU/486SX).

> >68060 = P75
> What about the EC versions and such??? Any thoughts on this?
>

That is based on current Amiga upgrade boards (actually for the last few
years) and the relative number crunching performance of a 060/50Mhz EC
version (I believe) is that of a P75. Ofcourse, with a clean system
architecture such as the Amiga (and Hades probably) coupled with a lean OS
the "feel" is similar to that of a P200MMX, at least in the Amigas case.
As an example, the 060 commercial release of Quake for the Amiga performs
roughly the same as on a Cyrix P166+ or a Intel Pentium 133. This is a
feature for feature version of Quake, except for the extra options that
were not available on the PC version.

Sure, it works but it's hardly usefull. I installed Win95 on a 386DX40,
with an 80387, 16Mb RAM and 64Kb of external cache and it ran quite well,
considering.
It also ran Quake, very slowly...

Using the upgrade version, the minimum disk space I've ever managed to
consume for Win95 was 50 odd Mb. How you got it on a 30Mb of drive space is
interesting.

Regards,

Clockmeister.

True, but I think Clockmeister more likely referred to the "common" use of
those processors, and thus, systems. But you're right if you limit
everything to processors. I do not dispute that the 386 is a more powerful
processor. I merely stated that the importants of various aspects of a
processor depends on such things as choice of software (e.g. operating
system) and choice of hardware architecture.
>

>The 386 is also a 32-bit processor. The size of the bus does not matter in
>deciding the bitness.

I know that... But the buswidth does partially affect system performance and
processor AVAILABILITY to software. Indeed, a 4-bit RISC CPU with a 28000
bit bus bandwidth can sometimes be used nicely with a constant data or
instruction stream.

But then the 68000 would also be, at least partially, 32-bit as opposed to
the 286.

Let me ask you a question: Atari claims the Jaguar's main processors to be 64-bit. From your point of view, that would be true. From mine, it would also be true because I agree with you on the processor standpoint.

But what if you look at it as a system? How would you classify it? Are its processors put to good use?

After this, try projecting that comparison onto a Wintel or 68K platform. All in all, people use systems not just processors, which means that a comparison might be difficult due to the many factors that are responsible for system performance under certain circumstances and with certain applications. It may well be that a Intel processor is better suited to certain tasks than a Motorola and vice versa, purely because of the type of application and use it makes of the processor. Add to that the way the O.S. handles it and the way it is put in the system architecture, and you might imagine the questionability or validity of black and white statements like A is more powerful than B.

IMHO, it all depends.

>Not to get into systems but PCs are definately the place to run linux. PC
>versions come first and are usually better tuned than their
>68K/MIPs/Alpha/Sparc/ARM counterparts.
Probably, yes. I just said "they run fine", not "better".   :-)
On SPARC I'd just use Solaris btw.

But what you provide as argument as to why PC's are the place to run Linux is true for a LOT of software, simply because it's the leading platform in terms of sales and availability. I didn't buy Atari because it was so readily available but because of the sheer pleasure working with its systems provide. :)

<<snip>>
I agree with you on the technical side of things, but I still believe that all is relative to many important factors when processors are put to use.

Yes it did. And so did NT 3.x. But the mainstream of 386's were either
Novell servers (cooperative multitasking) or WinDOS 3.x combinations.

Win 3.x did have virtual memory settings but only global protection and made little to no use of the MMU's powerful features. That was the main complaint of many Windows users who got sick of general potrection faults and such. Win95 offers better protection but the only Win-variety that offers true seperate memory protection is NT, and partially OS/2.

>Your list skips the 68030/68040.
I missed the 040 yes (had dinner prepared so was in a bit of a hurry...)
The 030 is in ther right next to the 386DX (read my post again :-)
since I believe that is the only real comparison between INtel and
Motorola in terms of technical specs that can be made. The 386DX
didn't have internal cache, did it? How much?

The 040 I would classify along the lines of 486DX varieties, and the 040
without FPU (LC040?) along the lines of the 486SX's.

<<snipped the rest we all know what we're talking about here :-) >>

And the actual performance thing is exactly what I was trying to make clear to others, since there seemed to be some confusing as to what you compared those processors by.

As for Win95 on 30 megs... I used the drivespace compression that comes standard with 95 and did some manual tweaking in msdos.sys (ascii file since Win95) and stuff. I just was in an odd mood and many people mocked me that I had a 386SX lurking around and thought you could only use WIn 3.x on it. So I accepted the challenge to put "their" Win95 on it :-) I even added a speaker.drv from an old 3.1 version to the system and I could play Wave files through the PC speaker.

They didn't believe what they saw, but it can be done with a bit of playing and fiddling around. Most important thing is: you have to outsmart Microsoft who claim a minimum of 50MB and check for that.

You can circumvent disk space check and install Windows on a compressed volume. Just make sure the bootfiles for the system are on the host drive and msdos.sys points to the compressed volume for the rest of Windows. It worked. I must say it is a while ago since I've tried this and since deleted Win95 from that system. I mean - you don't really expect me to run that system that way?

I also have come across an interesting DOS version from Caldera (OpenDOS, former DR-DOS, later renamed back). It's free nowadays and provides limited multitasking. Okay it's not exactly Unix or Amigan or Atarian standards but... it's nice playing around with every now and then. :-)

The 386DX had no internal cache, and only a relatively few 386 motherboards had external cache. (Any CPU can be cached externally so that's not important anyway)

The 68000 is considered a 16-bit implementation of a 32-bit architecture.

> Let me ask you a question: Atari claims the Jaguar's main processors to be
> 64-bit. From your point of view, that would be true. From mine, it would

I look at context when thinking about "bitness". In a general purpose
processor, the size of the address registers decide the bitness for me. In a
graphics or bandwith sensitive system (like the Jag), the width of the data
registers or databus decides it for me.

> But what you provide as argument as to why PC's are the place to run Linux

Running linux would even a lot of that out.

Agreed. But there is a modus in which you can view the "common" or "generic"
type and way a processor is generally / commonly implemented in a system.

For the 68000, this would be in laser printerd, in Palm pilots and "A-team"
(Atari/Amiga/Apple) computers and miscellaneous 16-bit video game systems.
>
>> But then the 68000 would also be, at least partially, 32-bit as opposed

>The 68000 is considered a 16-bit implementation of a 32-bit architecture.

What does this say of its bitness? WHY is it considered a 16-bit
implementation? I'd say a 386SX is considered a 16-bit implementation of the
386/DX as well. Is the 68000 a 24-bit processor? I mean, you seem to not
consider a generic 68000 system necessarily badnwidth-intensive, so by your
standards it would mean that the 16-bit bus is not that important.

Care to enlighten me / us ??

Define "graphics or bandwith" sensitive system? It's not fair to use one
standard for one and another for the other. IMHO, PC's are bandwidth
sensitive systems if they're used for graphics intensive apps such as games
and FMV stuff.

It's good to put everything in a context but you need to provide that
context in your discussions, something that Clockmeister perhaps forgot or
negleckted because he probably thought he was clear enough on that for most
of us.

Some people might even say such a differential comparison may be considered
hypocritic, so I'd suggest to be careful and on the safe side, so it's
better to provide the context somewhere along a thread that can be referred
to, just to make things clear and put everything in perspective. :-)

Yes, agreed. Both processors are 32bit internally, and operate as such and
only have 16bit outside access. Strictly speaking, they are both still
32bit processors, only handicapped by the external bus which limits
throughput, but not functionality of either chip.

Is the 68000 a 24-bit processor? I mean, you seem to not

So by your definition, if a 386DX had a 64bit databus it would be a 64bit
processor. The databus has no influence on the actual processors "bitness".

Sorry, I thought it pretty clear but should have explained a bit better I
guess.

My pentium (12 months old) is slower than 'todays pentium' ...

boo hoo, I'm so upset ...

My Atari STe runs at 8 MHz ... snigger! But you'll never get it off me
for love or
money. There's a lot of loyalty for the TOS platform ... tough luck
TIFKAS.

Not taking any sides in yet another hardware performance debate, but even the most obstanate of debaters on both sides of the issue must admit that for most personal computer users, the real issue is going to be what SOFTWARE is really needed. For most users, the hardware is going to be a secondary issue. Without the necessary SOFTWARE, the most powerful hardware in the world would be totally useless.

The greatest variety of software at this time, unfortunately, is going to be found in the Windoze environment; and that includes in most cases, the necessary software to install many of today's hardware peripherals.

Some examples: If a person's primary need is to be able to play 8-bit games and educational software, an Atari 8-bit system may be the best choice. For MIDI applications, the timing of the Atari 16/32 bit systems can hardly be beat, although most newer software packages are NOT going to be written for those systems any more.   For quick and easy Internet access as well as the ability to run most newer software applications, a Windows system will definitely be easier to set up for most people. For the easiest possible setup and ability to run a good variety of contemporary software, an Apple system may be a good choice.

Bottom line, for most people, the BEST system is going to be the one that can run the software the user wants to be able to run. As far as operating systems goes, my personal favorite has always been Atari TOS. It is clean, fast and simple, yet able to do most everything one can possibly want an operating system to do. Unfortunately, the major downside of Atari TOS is

that there is going to be very little NEW Software written for that
otherwise excellent operating system.

I'm still using, and greatly enjoying, my Atari TT030 system, but also have
an IBM 450MHz P-II Win98 system for the ability to run more contemporary
software applications that are simply not available for the Atari system.

Best regards to all.

Sheldon

Quit dodging the issue...In all its buggy state, W9? can eventually get the
job done and still run those browser apps that are not available for TOS.

The market does not agree with your iMac pricing criticism.

>   3) Cost factor - well, you can cut the cost factor right down when

"The corresponding sucessor of the Motorola 6800 was the 68000 series. Early members of this family, including the 68000 micropressor chip can be regarded as 16-bit implementations of a 32-bit architecture." - Computer Architecture and Organization 2nd Edition

Personally, I would classify the entire 68K series as 32-bit but I'm not John Hayes.

> Define "graphics or bandwith" sensitive system? It's not fair to use one standard for one and another for the other. IMHO, PC's are bandwidth sensitive systems if they're used for graphics intensive apps such as games and FMV stuff.

I'm thinking about systems like the Jag where the size of the address registers is not relevant. The Jag doesn't need to address more than 4GB or memory so giving it 64-bit address registers is a waste of resources. Giving it 32-bit GPRs and FPRs is definately not a waste of resources. Neither is giving it a 64 or even 128-bit databus.

not necessarily true, see
http://www.clark.net/pub/lawrencc/linux/faq/faq.html
to quote: "The present 2.0 series releases are of "production quality"
and are suitable for general use on the Amiga, Atari and supported
Motorola VME (162, 166 and 167) platforms. The versions of the 2.1
series are generally as stable as their counterparts on Intel platforms
(probably even more stable, as there is more testing between
releases).

It depends entirely on what sort of bloated OS you're running.
For Windows bloatware,or anything else less trim than GEOS, a
386 in no way trumps a 68000.
[deletia]

Also, 'modern' OSes are crippled in anything less than 12M.
While that's nice if you've finally gotten to run Unix. However,
for things as simple as WinDOS or MacOS, that's pisspoor.

```

The big difference here is that OS/2 and UNIX are good, efficient operating
systems whereas Win95/98 are not.
I think any operating system shouldn't be judged on face value, rather by
the strength of it's core. In that regard OS/2, UNIX, POSIX, QNX, Linux,
AmigaOS, MINIX, and others are sound at core level, which isn't the case
with Windows 95/98 and MacOS IMO.

Feel free to disagree here.

Regards,

Clockmeister.

And its Christmas...the biggest selling season of the year. And since the
esteemed writer has shown they have never heard of a "loss leader" in
retailing. this tactic will result in some extra sales. But it will also
bring in folks who end up buying a PC or some other electronic gear or
appliance once they are in the store. If they sell something at a loss,
that cost could be written of in terms of Advertising expenses, so its not
like they really lose any money. What they gain is customers.

Too bad sinclair doesn't understand retailing..

How does he classify the 386SX? By what standards? If he does not classify
it the same as the early 68K series, he is at least in part, pretty
hypocritic in his statement. By the same comparison standards, the 386SX is
a "16-bit implementation" of the 386. Define implementation.

I said that Intel versions come out first and have better performance. This doesn't contradict my statement. Last time I checked, the 68K version of Linux was 0.0.2 behind the Intel version. I am alse keeping current on the GnuStep project and Intel support is definately the best. As for stability, you should avoid tracking the latest releases if you need very high stability for your purpose (though I track the latest releases and Linux hasn't crashed for 3 months).

Yah. It seems no different than the catalogs dealers who are offering
additional RAM on top of Apple's deal, or RAM + Software, or RAM + a USB
scanner. A cheap VCR is in the same price range of that equipment ($80 -
$120).

>He stated it not me..

nope, you twisted a glowing review of the Hades from a satisfied customer into one of your screeds against all things Atari. No one was fooled.

> hmmm, where do we begin:
>

>If he wanted kept private he should have not sent it.

Irrelevant. It was a private letter, you should of at least asked permission to post. Of course, being the boor you are, you decided that this was a personal attack and decided to "punish" him for daring to contradict you. Unfortunately, your plan backfired, and your reputation went even lower in many people's eyes. Quit dodging the issue.

> Hades users - guess he can't use one of his expensive G3 towers to hold it up as a yardstick)

>Quit dodging the issue...In all its buggy state, W9? can eventually get the job done and still run those browser apps that are not available for TOS.

I'm not dodging the issue - seems you are. Why should I want to run a dog operating system like Windows '9x (which you admit is buggy and bloated) and run IE4, which has shown to have many security leaks over the last year or so, and doesn't even properly support HTML guidelines as set by the standards comittee? When I can run something like CAB on a Hades (which I HAVE done, unlike yourself, who can only pretend to guess) and get on the Internet easily and quickly without massive system overhead and requirements. Plus I have other web browsers (Light Of Adamas, Wensuite) at my disposal should I have my choice...

And if I want Netscape, I can easily run and load Linux, compile, serve. End of story.

You still haven't explained why you hold up a WINTEL system against the Hades instead of a Mac - perhaps because you'll be shown up for an ignorant fool again?

>The market does not agree with your iMac pricing criticism.

hmmm - well, in Canada an iMac costs $1,899 CDN - one can easily find PCs that will do the same job (and have standard ports for things like printers, scanners, backup drives, and have standard floppy drives) for HALF that (many also include a monitor) .

And like I said, I've noticed from my own observations in Mac stores that the iMac is NOT "flying off the shelves", but still sitting in boxes in their original release form. One company has only now begun advertising they have rev B's in stock.

And I don't give a rat's hiney for the market, TIFKAS - in fact, I hold the opinion that 10,000,000 Elvis fans CAN be wrong. Besides, with no hard numbers (which you and InCompUSA refuse to divulge - imagine what Saddam Hussein could do with such info!), we don't know how many iMacs there are really out there. Reports are also coming in that Best Buy is also up to their old tricks (check out Dejanews for the thread "Best Buy Sucks At Selling iMacs" in comp.sys.mac.advocacy for an incredible first-person account of BB salespeople cluelessness).

I notice that you're also dodging "underpowered". Guess that now that the evidence is out how Apple rigged the G3 tests, and that real benchmarks are out that shows that a 300mHz Celeron toasts an iMac, and a 400mHZ Pentium II can finish the job, that you're suddenly realizing that the Steve Jobs Reality-Distortion Field� is of no use in comp.sys.atari.advocacy.....

> 3) Cost factor - well, you can cut the cost factor right down when you buy the motherboard kit from the dealer and add your own parts to PC

> prices - and it's worth it.. Of course, TIFKAS will whine that it's all "hack n' slash", but then mummy must have told him never to touch a motherboard as there might be icky germs that might get inside him the next time he picks his nose......

Avoiding the issue..

how am I avoiding the issue when I stated quite clearly that one could reduce the cost by buying the motherboard from the dealer, assembling your own parts from PC dealers at the best price and then doing it yourself? Since Atarians are hobbiests and have done many types of modifications to their computers (which you have constantly derided as "hack n' slash", which is well-known with anyone you went up to and lost against), this should be a natural for them (and easier, too, as it will just involve plugging things in). Can you build your own G3 Mac in the same way for less cost? Nope, I didn't think so. It's you who's dodging the issue by totally ignoring a clear statement on my part...

BTW, I think mummy also told you that keeping your head "up there" was a no-no, as the lack of oxygen could lead to brain dama...ooops, too late :)

> 4) He picked the wrong guy to try to argue with and smear- as you can see, Edward actually OWNS a Hades, and knows it inside out and what it does. Anyone who tries to wheedle a negative turn out of a GLOWING POSITIVE RESPONSE for his choice of computer must be in dire need of a vacation (or else he hasn't had his two o'clock slapping). I predict Edward will reply to this, and I shudder to think what will happen to TIFKAS when he's faced with someone with actual facts instead of Steve Jobs Reality-Distortion Field� - inspired FUD.....

>He stated that a Hades is as fast as a 200mz-300mhz Pentium. I believe he was being genorous here. Also considering 350-450 MHz are common..

unlike you, TIFKAS, Edward knows what he speaks of (your knowledge of PCs is just as abysmal as your knowledge of Ataris and TOS). And I don't see anyone leaping to your defense here - in fact, in all the years I've been bashing heads with you, I don't remember one person piping up to defend you, but a lot of people coming on and refuting every piece of drivel you've posted.

Funny thing, TIFKAS, is that the recent postings are having the OPPOSITE effect you were hoping your FUD would accomplish - I've had at least three or four requests for info on where to get the Hades, getting parts, what software works, etc. And I've gladly given it to them, or pointed them in the right direction. Guess now that there will be more Atarians out there, you'll be redoubling the FUD - which of course means another refutation and absolute humiliation on your part, and more people clamouring for info from me, which means....is it really worth it to you?

> 5) TIFKAS loses further points because his choice of "newsreader", DejaNews, has totally smushed the letter to the point that it's painful

> (and pointless) to try and read his fanciful spin on the facts. Surely
> one who has bragged loud and long about how Netscape Communicator and

> jar of Vegemite!

>Dodging the issue here. Newsreaders will be obsolete soon as portals
>espicially personal web pages with usenet feeds take over...

Not dodging the issue. Your trotting out vapourware and vapour situations is dodging the issues on your part in response to a legitimate criticism of your posting style in the HERE and NOW.

Vegemite - 2,056, TIFKAS - ZERO .

> Quit crying over spilled milk...Will not get you anywere..

we all know whose maturity level stopped at age three here, TIFKAS - and we all know who's been having the hissy fits when they've been soundly refuted. And they haven't gotten you anywhere - in fact, they've cemented your reputation as a little loser troll with no life.

> BTW, TIFKAS - I notice you still haven't responded to MY rebuttal of
> your pathetic attack on the Hades. Chicken? (and BTW, I sent e-mail to
> the guy you gave the FUD to with the real facts on the Hades - you're
> not going to like what he told me what he thinks of you and you
> disinformation campaigns, but then I keep much of my e-mail
> correpondance private, and always ask permission.....)

>Oh must of not seen yet...Been busy earning a living and enjoying a life you
>sorely must lack.

or more likely, you're afraid that by answering the original missive you'll show yourself to be an even bigger idiot.

Since you refuse to show any proof that you really are an Apple Power Rep, your overblown claims of money, cars, women are suspect - or that you even have a life. I at least when I'm on the USENET involve myself in other forums than the computer ones. I'm learning Johnny Cash songs. I'm steeling myself up to start recording my own songs after Christmas. Getting Christmas shopping done. May even get out the bike and ride (it's been nice warm weather in Toronto lately). Might even check out a movie at the new 9-theatre mega-complex that's opened up in the mall where I work.

BTW, folks, if TIFKAS responds to this by stating where he'll be next at an InCompUSA and he's in your area, e-mail me - I Have A Cunning Plan that will be non-violent but will properly humiliate the little schmo..... :)

>Seriously 'Chunks', invite your sweet heart home and prepare Campbell's
>'Chunky' soup for her and she will kiss you...   Works everytime...

still talking to your imaginary friend, TIFKAS? Don't worry, it'll all be better when mummy gets home and feeds you a big tray of Cheezy Poofs....

(picture TIFKAS as a 400 lb blob speaking at a rally - "Follow your dreams! You can achieve your goals! I am living proof! Beefcake! BEEEEEFFFFFFCCCCAAAAAAAAAAAAAAKKKKEEEEEE!")

> Hmm, I now predict that TIFKAS will post another lame flame to his
> imaginary friend "Chunks"......

> And you will reply//

well, I am my brother's keeper - and someone has to steer your delusional butt over to the funny farm when you keep insisting on posting to people that aren't there....

(picture TIFKAS sitting at his computer and getting angrier and angrier - "can't....kick...ass.....can't....kick....ass......)

Not only that - in recent days 'Futile Shop' has reopened its shelves
to Apple product which indicates something about market 'acceptence'

Now, if I could only buy a full G3 at an HP or Compaq price (including
some software which Apple sells as an add-on.

I'd still like to even see a Hades in Western Canada !!

>Eh that Hades is old tech and over priced...

So is the iMac. Like we care? What new
has new tech got to offer US?

What new apps can we run that we couldn't run before?
Do we want those apps?

Old tech or not, the Hades has some nice OS's to guide it
as opposed to the "leading" platforms' bloatware attempts
at OS's. Now, even the "second choice" leading platform
that YOU are so fond of... is funded by M.

The best facts of the world are not going to do you any good if you're not
qualified, intelligent or cogent enough to place them in proper perspective
and adapt them in a proper, objective context as to utilize them as
measuring tools.

All you can cry out is browser browser browser. I HAVE to use W9? and WinNT
and all sorts of other DOS and Win varieties as a network administrator and
I am pleased about their flexibility in connectivity. However, I would NEVER

turn in my Atari for any of them, because of
1) their stability problems (yes that includes NT, ESPECIALLY as file servers, IMHO you'd better use them as application servers -> what they're good at -> and use Novell Netware as a file server) crash crash crash... perhaps you should visit alt.microsoft.crash.crash.crash or somethin'
2) their memory-hungriness
3) their hardware resources problems.... sooner or later, address space and interrupts become an issue...

We DO NOT want THOSE browsers. We have our own, and they're fine. You wanna know what browser REALLY cuts it on those Wintels? Opera (not more than about 1.4MB as opposed to IE4 and NS). It supports many different platforms as well. :-)

And Atarians have CAB, and a number of others which all work just fine for our needs, and most of all... FAST compared to the Wintel monstrocities.

Yeah just as nice as all that webbased E-mail access huh... no thanks. And
now you may think... "but you're using Net@ddress..." That may be true, but
only to keep my business mail seperate from my personal/private mail AND I
access it using a POP client (thank goodness they provide that option, the
main reason I use netaddress.com and mailandnews.com)

Right, I think ""enjoying" is the keyword here. I too have a PII 450 with Win 98 installed. I had to convince my boss that I really needed all that horse power. Much to my suprise, once out of the box, I find that Win 98 has a real doggy feel even on that machine. My 040/NOVA Falcon with MiNT and NAES is really much more usable in terms of a GUI, IMHO. But egadd, when I went to unzip a 10 megabyte file, it was over before I could blink. The Falcon would have had to work on that a while:). I know there are alternative O/S's for the PC, but I am not into command line stuff, and like the point an click feel of icons.

The processing power is nice on the PII. Kia's Power Tools and such really come alive compaired to running the same software on an 40-040 Mac.

But the fun factor still goes to the Falcon. It's the one I go to sleep with every night:).

He classifies the entire 80386 series as 32-bit. Probably because every 386 has 32-bit data and address registers. The 68000 had only 16-bit data registers. The size of the bus is irrelevant to him. Remeber that the 68008 only had a 8- bit databus but most people would still call it a 16-bit chip.

     Actually, the 68000 had 32bit data registers. It was the

     external bus that was 16 bit.

Company Press Release

SOURCE: CompUSA Inc.

CompUSA Reports Record iMac Sales Again;
Weekend iMac Sales Beat Record Set at Product's
Launch

DALLAS, Nov. 12 /PRNewswire/ -- CompUSA Inc. (NYSE: CPU - news), America's
Largest Computer Superstore retailer, reported
record iMac sales for the second time since the product's retail rollout
on August 15. Last weekend's iMacs sales were the largest since the
product's initial launch in August, making iMac the best selling personal
computer in CompUSA's history.
```

``We're seeing iMac continue to gain momentum with first-time users and families who want to explore the Internet,'' said Jim Halpin, CompUSA president and chief executive officer. ``Our customers are telling us iMac is stylish, easy to use, and since customers can now get it for $29.99 a month, iMac is a great holiday value.''

``Across the nation, iMac was the number one selling desktop model in PC superstores in August and September with 12.3 percent and 9.8 percent channel sales respectively,'' according to Matt Sargent, industry analyst at ZD Market Intelligence, a leading industry research firm that tracks technology distribution channels.

CompUSA plans to continue attracting new customers to iMac with a variety of promotions and incentives. This past weekend, incentives such as free USB peripherals triggered a significant increase in store traffic and sales. Apple's recently introduced financing program, which enables customers to buy an iMac for just $29.99 per month, was also cited as a draw by CompUSA customers.

CompUSA Inc. is one of the nation's leading retailers and resellers of personal computers and related products and services. The company currently operates 209 CompUSA Computer Superstores in 78 major metropolitan markets across the United States that serve retail, corporate, government and education customers and include technical service departments and classroom training facilities. CompUSA also offers its own build-to-order personal computer series, the CompUSA PCTM, and operates an Internet web site located at www.compusa.com where customers can obtain information about the company and shop its on-line catalog.

You know, somebody in CompUSA's chain ought to take a hard, cold look at the
assholes that work in the Baton Rouge, Louisiana location.  Not a day goes
by at that store that a customer doesn't walk out cussing at the top of his
lungs about their crappy service.

I should know - I was a tech there once.

>What were you saying about cedarnet?

that you were reprimanded for posting MCIBTYC drivel in comp.sys.atari.st - NOT that you were removed from Cedarnet. (In fact, I requested that Cedarnet NOT remove you but that they deal with you accordingly. The fact that you stopped posting there immediately after the letter was sent proves that something happened - and was NOT in your favour). Looks like your attempt to rewrite history has failed - AGAIN.

hmm, another set of addresses to add to POPwatch's killfile. BTW, you phone there long distance to send the drivel, or are you not in Missouri as you claim?

In either case, you were warned not to send me e-mail. That still stands.

<rest of unverifiable self-serving drivel snipped>

yeah, I was waiting for you to publish that press-release - it fits your modus operandi.

Interestingly, I notice that there were really no hard numbers posted. Also, in mac.advocacy, a number of their denizens are musing on how much the press release sounds like it was written by Apple's ad agency. Could they be going into damage control after the ZDNet article?

Of course, InCompUSA needs all the help they can get - lost around $50 million last quarter, n'est-ce pas?

Plus Best Buy - reports are that the salesmen are treating the iMac with contempt around the US, just like when Apple tried being distributed by BB the last time and crashed and burned. Guys in mac.advocacy are placing bets now that your uberboss and boot-lickee, Steve Jobs, will be pulling the plug on BB by February...

My own research revealed something interesting - if the iMac is indeed being sold as fast as they're being produced, then all the new ones that are in stock should be the new revision "B" models (with the faster graphics card - Jobs blinked!). Howcome, then, that when I went to several Apple dealers, including CPUsed, the College Street Mac store, and Computer City (aka InCompUSA North) all I could find were "A" (or should that be "eh" :)) iMacs - and all the display models were "A" models. Quite a few of these "A" models sitting in boxes. (Mac.advocacy is reporting that some Apple dealers are offering discounts for the original-issue iMacs over rev. B - they still have back stock?)

Oh, and Compucentre - the Canadian distributor you were bragging about? They certainly got to a good start, charging $50 OVER the CDN MSRP for the first two months for something that's already over priced, overhyped, and underpowered- looks like Jobs should've done his homework before signing the papers......

methinks that rather than coming here looking for stray airdales to kick, and finding only hungry Rottweilers, you may want to go into mac-advocacy and start spinning damage control THERE. Of course, the reason you don't hang out there is that you'd be a pile of onion rings in seconds ("curses! broiled again!") :)

here's a cross-post from comp.sys.mac.advocacy (you know, the place where TIFKAS <The Idiot Forever Known As Sinclap> is too afraid to post or read) about the recent InCompUSA press release claiming they've set another record sale for the overpriced, underpowered iMac. Although short, it certainly sheds some light on what others are thinking......

My go...

Hypothetically speaking... (as neither C= or Atati exist anymore)

Commodore would never allow themselves to be dragged down to the bottom of the barrel where Atari lives.

Commodore where the wine that almost everyone drank and caused huge enjoyment amongst the consumers, where Atari where the skunge at the bottom of the barrel which an unfortunate few found pleasure in.

How about this one...

Atari users later became iMac users. (bottom of barrel theory still applies here)

Or this one...

Jack Tramiel wanted to merge with C= because he realised his own contraption, named the "ST" was technologically challenged compared to Commodore's Amiga.
Nevertheless, armed with only a MIDI port with intention to trade for the Amiga custom chips "Fat Agnus", "Paula", "Gary", and "Denise" he went of to pay a visit to Commodore.

Said Jack,

I have this to trade...

C= said,

What, a DIN connector???

Said Jack,

Yes, but an integral part of my ST.

Said C=,

So what do you want?

Said Jack,

A trade, a merger, my DIN for your Amiga custom chipset, and operating system.

The C= camp...
Bwaahhaaaahhaaaa heeehehehehheee!!!!!!!!

Jack, you remind me of Apple who came for our glorious OS because it has preemptive multithreaded multitasking and theirs doesn't he he he!!!

... 15 years later...

Apple still hasn't got a preemptive multitasking OS...
BWWAAAAHHHHhehehehe!!!

:-)

Regards,

Clockmeister.

Commodore sucked, otherwise they wouldn't have let a machine as far ahead
of its time as the Amiga was, die on the vine... ;(

->Commodore where the wine that almost everyone drank and caused huge
->enjoyment amongst the consumers, where Atari where the skunge at the bottom
->of the barrel which an unfortunate few found pleasure in.

I hated the C-64, but thought the Amiga was okay. Except for its OS, which
was strange in early versions. (I like WB 2.x and up though).

->How about this one...
->
->Atari users later became iMac users. (bottom of barrel theory still applies
->here)

No way, dude... No self-respecting Atarian is gonna ever sink that low.

->Or this one...
->
->Jack Tramiel wanted to merge with C= because he realised his own
->contraption, named the "ST" was technologically challenged compared to
->Commodore's Amiga.

ClockMeister, you and I have been through this debate. Are we gonna
rehash old material again? ;-)

->Nevertheless, armed with only a MIDI port with intention to trade for the

->Amiga custom chips "Fat Agnus", "Paula", "Gary", and "Denise" he went of to

Hehe I knew it would provoke SOMETHING :-))))

Although we have been through some aspects of your posting, and we mutually disagreed :-)

But think of it. Combine a Falcon, a Jaguar and a high-end Amiga in every conceivable way (well okay, the good things 'bout them, not counting OS because you could merge those or trade eachother's features (or bugs, as Microsoft calls them.. errrrr gotcha! ;-)) and place it in the hands of a capable mass producer and/or marketeer, e.g. Sony (never mind their

playstation pretend it doesn't exist and also pretend they're not heading
for the computing hardware market next year)

...

on a rather sadder note, I was at !ndigo books today on my lunch hour and went looking for a particular PC magazine (only for the CD-ROM, which had tons of Christmas clip-art) and noticed that the latest issue of Amiga Magazine - the UK Amiga mag - was also its final issue. Ironically, it was still pretty fat, compared to the slimmed-down state ST FORMAT found itself at with its last issue.

My condolences to the Amiga community. I actually bought an issue about four years ago (again, to get ahold of a clip art/sound file/MOD CD) and though not an Amiga user I read that issue from cover to cover - well written and laid out, and quite frankly I found myself wishing I had some of those programs running on my Falcon :)

What's the general health of the Amiga magazines these days - for instance, is Future planning to cut back its Amiga coverage? And also, like ATARI COMPUTING, are there any home-brew magazines being put together and sold via subscription by Amigans for Amigans?

Again, my condolences.....

a little update to the TAF MonSTEr Flea Market on the 18th of this month....

Those on this forum in Canada who have been wondering about Mario Becroft's new PC Mouse Adaptor will have a chance to see this little gizmo in action at the Flea Market, as Ken Macdonald has brought in five of the little beasties which will be demonstrated. Three have already been earmarked as sold, and TAF is currently looking at putting in an order for more.

BTW, I got a chance to play with one of them at our exec meeting Wednsday and was very impressed - especially since it was attached to a Logitech 3-button mouse. The centre button was configured as a double-click, and was very quickly gotten used to. The Logitech is also very ergonomic and fit the contour of my hand real good. One other thing - Mario has designed the adaptor so that it plugs into the mouse port, then the cable runs under the machine so that the plug for the PC mouse can attach behind the computer - great idea!

anyway, details for the Flea Market follows.....

WEDNSDAY, NOVEMBER 18, 1998 is the date for the Toronto Atari Federation FLEA MARKET! The doors open to the public at 7:00 PM and will remain open until 10:30 PM.

This is your chance to come to a bazaar of Atari related pre-owned hardware and software where you may find that peripheral, application or utility for your ST/Mega/TT/Falcon 16/32-bit computer system or your XL/XE 8-bit classic computer system.

If you have original software or hardware that you no longer have any use for, get yourself a half-table and try to sell it! Or find that treasure that you have always wanted. Great deals should be in abundance.

Half-Table's will be $5.00 or the Full-Table for $10.00 each. Half-Table's are FREE to TAF MEMBERS. Admission is $2.00 per non-member family but if you are selling and have taken a half-table or more, admission is inc- luded. Admission for TAF members is, of course, Free.

The Flea Market will run from 7:00 PM to 10:30PM, with setup commencing for sellors after 6:30 PM, and teardown after 10:30 PM. This should allow enough time for as many people inside and outside Toronto to attend the event.

As usual, piracy cannot and will not be condoned. You must be selling original pre-owned software only. If anyone is caught selling pirated software or stolen hardware, they will be dealt with severely!!

The TORONTO ATARI FEDERATION Flea Market will be held in the "Rose Room" of the North York Memorial Community Hall on the Lower or Concourse Level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkhome Ave. Parkhome is 5 stoplights North of Hwy 401 running East off of Yonge

Daniel, was that Amiga Format? I'm amazed if it is. Thought it was still relatively healthy. I know at the Amiga's heyday in the UK, their circ. was something like 150,000!

I have a few Amiga's as well as all my Atari's and I still get an Amiga magazine here in the US-its called "Amazing Computing (Amiga)", and is a nice little publication. There is also a bi-monthly (not color) mag that is put out, but I forget its name (Amiga Informer, I think).

Gateway, after purchasing the Amiga, formed a new Amiga group, and they made some interesting announcements concerning new product developement. If they deliver what they have promised, then it would be well ahead of any hardware/software currently in use. Time will tell, I guess. ;-)

CU Amiga has just gone under (the one I think the original poster may have
been referring to), mainly due to a change of ownership of the publishing
house. Some other magazines were also axed.

And yes, only time will tell...

Agreed. C= did suck big time, there is a fair bit of sarcasm in my post, as you may have gathered. What C= did (or didn't) to the Amiga is criminal.

22Million C64 sales speak for themselves, and it was a revolutionary home computer that captured the users imagination. You can't take that away from the C64.
WB1.2 and 1.3 were pretty poor, much like early GEM/TOS IMO.

Yeah, you're right!. And people wonder why some still use Atari and Amiga computers... with the Apple and Wintel stale efforts, some of us will stick to computers that are actually fun to use.

hmmm, I notice that missing from your jingoistic MCIBTYC drivel is the non-overpriced Milan ($899 US, lower with motherboard kit) which includes standard PCI slots for connecting a variety of standard PCI boards (like graphics and sound cards). Not to mention standard printer and serial ports that don't require USB kludges to run standard hardware like scanners and printers.....

As for the 040 - well combine it with an elegant, tightly coded OS (unlike the bloated System 8.5) and you'll get a wonderful machine that'll run rings around an iMac and kick its little plastic butt. TOS gets right what Apple couldn't the first time. :)

and surprise surprise - the Hades is still alive. Not only that, but it can run Cubase right out of the box - something the overpriced, underpowered, underfeatured iMac is yet to do......

try harder weinerhead. If the iMac really is "flying off the shelves" (which my research has shown to be not the case), then there would be no need for InCompUSA to bundle iMacs with VCRs, or put together bogus payment plans (which, after six years, would well put what you'd paid for your iMac at over $2100 - now THAT is really overpriced).

The hard numbers are not released for competitve reasons. All I can say to
comment with out divulging non disclosure data from were I sit is that CompUSA
can make that claim rightfully.

Best Buy has been a mix bag. Some stores have a different tune and are doing
well. May take several months for all the stores to fall in line. I am sure
Apple is aware of this and is taking appropriate action like hiring Power reps
to evangilize and train.

May have to do with a couple of factors: a lul in consumer computers of all
makes in October and the news or leaking of the iMac B's existant on the
internet put a damper on the remaining sales of iMac A's which are dwindling
in the channel.

Evolution: Measuring iMac sales a tricky business

By Eric Yang

This is my first column for MacWEEK.com, although some of you
might know me from my
Macintosh Evolution Web site, where I have been tracking Apple's
financial health with a group of

Apple investors for the past 12 months. I had intended to write about Apple's corporate structure, but that plan was tossed aside after an inflammatory article on iMac sales, by ZD InfoBead Insider columnist Aaron Goldberg, grabbed headlines last week.

Goldberg wrote: "Our data showed that in the initial two weeks, from August 15th until the end of the month, an average of 20,000 units were shipped per week. However, in September, iMac volumes dropped to just slightly over 9,000 units a week on average for the month. Clearly not good news."

Based on those figures Goldberg speculated that the iMac must be losing its appeal, but his conclusions are flawed. The variation between August and September unit-shipment volume was a reflection of Apple's distribution strategy and has little correlation with the popularity of the iMac.

The InfoBead survey was limited to the U.S. retail channel, or approximately 25 percent of Apple's total market. The survey did not reflect the international market, education channel or corporate sales.

Months before iMacs hit the shelves Apple anticipated there would be heavy demand for the new product. The company was well aware that even if its manufacturing facilities in Sacramento, Calif., and Singapore were running near full capacity it would not be able to deliver sufficient iMacs to support a simultaneous worldwide product launch. To solve this problem it carefully scheduled a series of launch dates spread over several months, giving itself some needed time to catch up with back orders and build sufficient inventory to support the next launch. The list below shows the sequence of iMac launches:

Aug. 15: United States
Aug. 29: Japan
Sept. 5: UK, Ireland, Germany
Sept. 9: Netherlands
Sept. 10: Mexico
Sept. 12: Italy, Sweden
Sept. 15: New Zealand
Sept. 16: France
Sept. 26: Denmark, Finland
Oct. 17: Singapore
Oct. 19: Taiwan, Estonia

During the two weeks after the initial iMac introduction on Aug. 15, almost the entire supply of iMacs from the Sacramento and Singapore facilities were directed to the U.S. market. Beginning with Japan in late August, iMacs produced from the Singapore facility were gradually diverted to other countries.

Since the InfoBead survey covered only the U.S. retail market, one would expect to see a drop in September volume. After all, during August all iMac production was dedicated to the U.S. market to fill back orders; September production was diverted to reach international markets. Goldberg's logic in using the 20,000-units-per-week rate in August as the benchmark to measure future iMac demand just doesn't hold up under scrutiny.

Suppose a trendy restaurant just opened. On its first day of business a small crowd gathers outside, and at 11 a.m. the doors open and people crowd inside. If the number of customers that walked through the door during the first 10 minutes was twice as many as the following 10 minutes, could one conclude that the restaurant isn't as popular as once thought or that the signature dish -- foie gras a l�iMac -- didn't quite live up to expectation? Certainly not.

Apple's quarterly unit shipment prior to the iMac's introduction had been averaging about 650,000 units. That roughly translates to 12,500 units per week for the U.S. retail channel. Keep in mind that the 12,500 includes Apple's entire product line -- everything from G3 desktops to PowerBooks. For Goldberg to expect a single product to sustain a 20,000-per-week volume in the U.S. retail market is absurd.

My current quarterly estimate of total unit shipment is about 960,000 units, with 500,000 of them being iMacs. Analyst Lou Mazzucchelli of Gerald Klauer Mattison & Co. also expects more than 550,000 iMacs to be shipped for the quarter. If Apple meets these numbers I expect the company to report knockout earnings in January. With the strong Christmas buying season still ahead, Apple is definitely on track to deliver those numbers.

Goldberg is known for his cynical views about Apple. While critical thinking is a positive trait for market analysts, skepticism is not.

In early June, Goldberg speculated that Apple may have practiced "channel stuffing" in order to manufacture profits, but the accusation made little sense. The company's increasing gross margin, decreasing in-house inventory and growing profit all conflicted with Goldberg's negative portrayal, and it was later shown to be unfounded.

Companies generally resort to channel stuffing only when they have difficulty meeting earnings estimates. Channel stuffing may boost profit in one quarter, but those who play this trick end up paying the price in subsequent quarters. Apple had already blown away consensus estimate for two consecutive quarters; if they were the result of channel stuffing, it clearly would have been overkill. Apple has since delivered two more profitable quarters, beating consensus estimates by 52 percent in the third quarter and 39 percent in the fourth. In conference calls with analysts, Apple plainly stated that channel inventory remained flat in terms of unit volume and continues to decrease in terms of value.

It just goes to show that no writer or analyst is infallible.

Independent financial analyst Eric Yang can be reached via e-mail at

    my weight (which you seem to overstress, since I'm not quite as

overweight as you think I am) does not inhibit any meaningful
relationship I have with women - which, by the way, is not measured by
sexual conquest or bedpost notching. You seem to be the one who has an
inadequacy problem in how you constantly brag about being a "macho
stud" - which is one of the marks of an internet "kook", BTW.

BZZZT! Wrong! As I have stated carefully before, I lodged a
complaint about you posting your MCIBTYC drivel to David at CedarNet,
who wrote back to me kindly and said that after talking it over with
the other people involved with the situation, conceded that YOU WERE IN
VIOLATION OF YOUR USER AGREEMENTS by posting said drivel (David even
said that you were "an obvious Mac Zealot") and that a warning (i.e., a
reprimand) would be sent to you. A day later, your posts stopped in
c.s.a.s but not in .advocacy (where said drivel rightly remains). Even
to this day, you rarely post to c.s.a.s, much like a whipped puppy
remembers what will happen if it soiled the rug again.

Your denials make for very amusing reading. Care to share with us
any more of your fairytales (like "90% of all TOS applications fall
over on the Milan", or "12 thirty-foot piles of Mac Software", or "I am
a realist") ? Another mark of "kookdom", BTW.

yes, you were. As a matter of fact, I even went as far as to say
that any attempts to send me e-mail would be constituted as harassment

and would be directed to the proper authorities. This due to your
well-known flaming e-mail campaigns. Check out Dejanews in the last
year for the original post....

the claim was being made that iMacs were "flying off the shelves",
thereby there should be, by reason, no original "A" iMacs, only rev B

iMacs. Like to see how you try to spin out of that one, whiner boy.

>

>Nothing to do with me..

everything to do with you. You posted a press release from Apple in .advocacy gloating about how CompuCentre had been signed as a distributor and how they would sell tons of iMacs in my backyard - forgetting, of course, that I could inspect my backyard and notice any rot. CompuCentre, as I said, couldn't organize a piss-up in a brewery, let alone sell tons of iMacs. Even now with iMac prices dropping by $50 at some dealers, they're still overcharging on the iMac in their stores. Time to admit you have egg on your face.....

>
>> methinks that rather than coming here looking for stray airdales to

->He he he... Pity you can't compare Falcon sales to the Amiga's eh? ;-)

Yeah, that is too bad. Just out of simple curiosity, what did the Amiga's unit sales wind up at. I know thats kind of a hard figure to generate, but last I heard (in Amiga Format, I think), it was something like 6 million, although I'd hazard a guess that there are not that many "active" users. Would you say that is about right? Thanks.

->Some of us have always had them! :-)
->
->Regards,

Some PC Clown named "JS/PL" <wauseon.@stopat.com> wrote:

> Despit what these threads indicate - the real public is behind Microsoft all
> the way

I DARED him to prove his point.

Here is proof that the DOJ investigation has the approval of the VAST majority of Americans. Bravo America. Boo JS/PL.

----

1) From <http://www.cnnfn.com/digitaljam/9803/03/poll/>

Many don't believe Gates

Majority don't believe Microsoft isn't trying to
monopolize the Internet

March 3, 1998: 7:56 p.m. ET

NEW YORK (CNNfn) - Where do you think Microsoft is going today?

A solid majority of online surfers told CNNfn Tuesday they believe Microsoft Corp. Chairman Bill Gates wants to control the Internet.

According to an unofficial poll conducted Tuesday, more than 59 percent of online respondents said they thought Gates was trying to monopolize the Internet and almost 56 percent said the government should do more to investigate the company.
The poll was based on more than 11,000 responses received over a nine hour period Tuesday.

. . .

---

2) From <http://cgi.pathfinder.com/cgi-bin/time/daily/gdml3/osform/generic>

Poll
Start Date: 10/27/1998

Was Microsoft Set Up?

Microsoft is accusing Netscape of orchestrating a "setup" for a government antitrust suit at the June 21, 1995, meeting between the two companies. Do you agree with Microsoft's contention?

RESULTS as of 11/14/98 with 67,685 votes cast so far:

YES: 2.25%
NO: 97.53% ***
Don't know: 0.21%

---

3) Here are the best results I can find even remotely in Megalsoft's favor:

From <http://cgi.pathfinder.com/cgi-bin/time/daily/gdml3/osform/generic>

[Having barely begun the trial I think this is telling:]

Start Date: 10/21/1998

Divide Microsoft?

Should Microsoft be broken up the way the old AT&T was?

RESULTS as of 11/14/98:

YES: 47.22%
NO: 51.83% ***
Don't Know: 0.94%

Total Votes Cast: 25351

[Personal comment: I find this shockingly enlightened! Bravo America! And we still have 80% of the trial to dig up more Megalsoft dirt!]
----

4) From <http://205.181.113.18/anchordesk/story/story_1978.html>

QuickPoll Question

Independent polls suggest Microsoft's brand image is suffering amid all its legal woes. Company execs maintain their ratings have never been higher. What do you think?

� I think less of Microsoft. It should quit feuding, get back to the business of building software.

� I applaud Microsoft. I admire the fact it is fighting the government, standing for principle.

QuickPoll Results

� I think less of Microsoft. 24066 votes (71%)   ***

� I applaud Microsoft. 9997 votes (29%)
----

5) From <http://www.network23.com/hub/msfine/>

Just how much does Megalosoft owe the USA for violated a court order to make available the Windows95� operating system software without requiring the installation of Internet Explorer?

The register is still ringing. The count as of mid-day 11/14/98 was:

$338,531,540

Still think the prosecution of Megalosoft is a waste of money kids?

Need I go on?

I don't think so.

:-D

Load"*",8,1 is all that is required to load most games, the peek and poke
commands where often used for games that didn't start automatically after
loading, to give infinate lives and such.

>   Note I'm not degrading the C-64, its just the path I chose...

Fair enough, The Atari 8 bitters where good machines, but I personally
liked the C64 better... the path I chose I guess.

Between 5 - 6 million, at least 5 mil but certainly no more then 6 mil.
The last estimation was that there are probably 1mil active Amiga users
left, most of which use more then one machine, a lot of which also own a PC
as well, some own a Mac (what a step backwards that is) , and quite a few
are game players using unexpanded A500's. Taking a bit of an educated
guess, I would say that about half of the remaining users have at least
WB2.05+ and some sort of enhancement.

He he... but the PC wasn't a competitor back then. I can't understand the

logic of people buying 8088/8086/80286 computers whilst Atari ST and Amigas
where around.
Early PC's where crap, come to think of it not a lot has changed.

>

Okay, so my original post at least generated _some_ feedback and a little thread, but it was all techie minded.

Whereas this is all O.K., try to step back for a moment and concentrate on marketing chances only. We just put or techie differences aside for now.

Suppose Atari and Commodore did merger and came up with a common platform based on both companies' techs somehow.

What would have happened to:
* the user base
* market penetration
* global sales

Bare my original post ("Atari and Commodore merge!") in mind regarding marketing and Sony.

How would this have affected the computing market today? Would that fictitious company have provided a viable platform to be reckoned with, next to Apple and Wintel? Would there still be solid support and a viable alternative in terms of points of sale and wide public support, not just fans like ourselves?

WHAT WOULD HAVE HAPPENED TO THE MARKET?

Any thoughts on this?

If the ruling body consisted of Atari/Commodore officials (The Tramiels and hmm-can't remember the Commodore guys) then the result would have been the same, although I think that their initial success would have been better, and they might have lasted longer... ;)

The only way history could have been changed was if different people had been running each company. Although brilliant in some ways, each made more than their share of business errors/bad judgement calls... ;(

Well, TBH-I'm trying to remember something that happened in, what...1983?
So what you say is probably right. I just know it was incredibly easy to
start games on the 800 and not as easy on the C-64. Oh well, the C-64 did
wind up getting a GUI, right?

->Between 5 - 6 million, at least 5 mil but certainly no more then 6 mil.

Yep, I agree fully. Bad management will be bad management, no matter how
big a company may be, and it will cause the downfall of that company.

I suspect the sales of an Atari/C= merger would have been roughly the
combined total sales of both individual companies. ie: the same.

Regards,

Clockmeister.

>had some of those programs running on my Falcon :)

It's a real pity, since CU was IMHO a better mag than its arch-nemesis.
According to what I have heard, it didn't fare very badly, but experienced a
slope udiring the summer, which scared stock owners, and since EMAP isn't a
computer publisher...

>   What's the general health of the Amiga magazines these days - for

With CU out of the way, I doubt that Amiga Format is in any way endangered.

There are home-brewn mags, such as the new UK Amiga games mag, whose name I unfortunately can't remember ATM.

>

The user base: would have gone nuts at first (Atarians and Commies are notoriously loyal to their machines). If the resulting product would have been nifty and an overall upgrade from the previous machines, then the user base would have adjusted, joined forces, and the resulting base would become

1.5 times larger than it previously was. Not double - these things are too much too hope for. But a time and a half. Anytime a large group has to merge with another large group, you lose (at least) 25% of the two groups together (people who just give up on the whole thing). There are many marketing examples to parralel this one, as well as other real-world examples.

Market penetration: just like the user base. 1.5. Overall, the merger would yield a marginally larger penetration than either company individually, but at a 'loss' - the 'loss' would benefit both companies, but not in a tremendous amount.

Global sales: There would be an initial spike, that would settle into the above mentioned 1.5 increase, which over time would grow larger or become smaller, based on executive decisions. Just like a good stock.

All of this is dependent on proper management, and great amounts of foresight on the part of that management. Which didn't happen.

The funny thing is, that with a proper marketing budget, either company would have surged to the front. They had a good, reliable machine, which was far more affordable than the 'competition'.

How would this have affected the computing market today?

If done properly, with proper management, either company could have done it alone (without merging), and we would all be using Ataris/Atari-compatibles instead of IBM compatibles.

If Apple would have continued down the same road that they travelled, then they would done the same as they have done. Except the "other computer" would be an Atari/Commodore.

Atari (and Commodore) needed to penetrate the small/medium business market, a market that was drifting away from mega-expensive mainframes and heading towards personal-level computers and office networking. Atari had an "IBM compatible" machine, but it was superior to the other IBM compatibles of the time, and thus, far more expensive. And Atari did not advertise the machine. Expensive, unknown machines simply do not sell. Commodore never produced a machine that could be used for business (that I know of). These were fatal errors.

Yes, it would be a viable platform to be reckoned with, and may have even stunted (or halted) the Microsoft cartel. There would still be solid support (as much as IBM clones). In fact, Atari would still be producing computers. Commodore too.

>WHAT WOULD HAVE HAPPENED TO THE MARKET?
>

We'd all be using a far more diverse group of machines than we are using now.

>Any thoughts on this?
>

well, here's what I found on CompUSA's recent report on their recent quarter. Although they did post a small profit, it looks like they're still in big trouble.....

COMPUSA SEES SALES TROUBLES Shares of software and hardware retailer CompUSA traded lower today after the company reported a 65-percent drop in net income for the first quarter, and warned that sales in the next quarter may come under pressure.

The company said it remains cautious for the second quarter of fiscal 1999, and is currently expecting "low-single digit negative" comparable store sales for the second quarter. Comparable store sales were down 1.7 percent in the first quarter. The company said corporate sales softness, as well as lower average selling prices for products, would result in lower sales numbers for the second quarter. CompUSA stock fell more than nine percent after the earnings announcement, but recovered to end down 0.1875 to 14.8750. Shares have traded as high as 38 and as low as 10.56 over the past 52 weeks.

The company said net income for the quarter fell 65 percent, yet it still managed to report results that beat consensus expectations. CompUSA earned $8.1 million, or 9 cents per share, surpassing expectations by 2 cents, according to consensus of analysts polled by First Call. For the year-ago quarter, CompUSA's net income was $23.5 million, or 25 cents per share.

"Although we are disappointed with our overall financial results for the first quarter of fiscal 1999, we are pleased with the improvements we have made since the fourth quarter of fiscal 1998," said CompUSA president and CEO James Halpin.

CompUSA saw net sales for the first quarter of fiscal 1999 increase 17 percent to $1.39 billion from $1.19 billion for the comparable period ended September 27, 1997. CompUSA said its first quarter earnings per share included a loss of 5 cents from the company's acquisition of Computer City. The loss includes costs of closing Computer City's corporate headquarters, and other operating losses from Computer City stores, according to a release.

"Since we announced our acquisition of Computer City, we have worked aggressively to implement our integration strategy," said Halpin. "We are focused on completing the integration and are excited about the opportunities to improve their operating results."

I was formerly a technician at Computer City before CompUSA bought them out (for the sole purpose of closing them down). After the buyout, I found myself working at CompUSA. From the inside out, that store sucks. I can't imagine anyone except a complete moron doing business with them at all, except to buy software. They do have good prices on software. But, don't bother buying hardware.

Your other sentiments are exactly on the mark. They don't pay their salespeople commission, so their salespeople could give a crap about helping you. In general, they are more worried about the cultlike atmosphere in the corporate sales office than they are about their retail front.

The Tramiels acquired a very crippled company. Their retail channel was blown up before the tramiels got to Atari. What's amazing is that the Tramiels kept Atari going for another 10 years. Atari's mistake was to merge with JTS, what a waste of 45 million dollars. Before the merger, Atari was actually in pretty good shape, and could have become a very successful clone manufacturer. The profits and revenues from making clones could have subsidized Atari's R&D. 1995 was a very bad year for any computer maker who did not use WIN 95. No small company could have survived a multibillion dollar advertising and promotional blitz like that. Atari did however have a huge portfolio of patents, 45 mil in cash and only 42 mil in debt. Financially they were in good shape. Tramiel gambled that Tom Mitchel could turn the company back into a fortune 500 company. Unfortunately JTS started about 1 1/2 years to late. Commodore on the other hand was a complete mess financially and could not continue. All debt and no revenues and no cash will always kill a company.

Evolution: Measuring iMac sales a tricky business

By Eric Yang

This is my first column for MacWEEK.com, although some of you might know me from my Macintosh Evolution Web site, where I have been tracking Apple's financial health with a group of Apple investors for the past 12 months. I had intended to write about Apple's corporate structure, but that plan was tossed aside after an inflammatory article on iMac sales, by ZD InfoBead Insider columnist Aaron Goldberg, grabbed headlines last week.

Goldberg wrote: "Our data showed that in the initial two weeks, from August 15th until the end of the month, an average of 20,000 units were shipped per week. However, in September, iMac volumes dropped to just slightly over 9,000 units a week on average for the month. Clearly not good news."

Based on those figures Goldberg speculated that the iMac must be losing its appeal, but his conclusions are flawed. The variation between August and September unit-shipment volume was a reflection of Apple's distribution strategy and has little correlation with the popularity of the iMac.

The InfoBead survey was limited to the U.S. retail channel, or approximately 25 percent of Apple's total market. The survey did not reflect the international market, education channel or corporate sales.

Months before iMacs hit the shelves Apple anticipated there would be heavy demand for the new product. The company was well aware that even if its manufacturing facilities in Sacramento, Calif., and Singapore were running near full capacity it would not be able to deliver sufficient iMacs to support a simultaneous worldwide product launch. To solve this problem it carefully scheduled a series of launch dates spread over several months, giving itself some needed time to catch up with back orders and build sufficient inventory to support the next launch. The list below shows the sequence of iMac launches:

Aug. 15: United States
Aug. 29: Japan
Sept. 5: UK, Ireland, Germany
Sept. 9: Netherlands
Sept. 10: Mexico
Sept. 12: Italy, Sweden

Sept. 15: New Zealand
Sept. 16: France
Sept. 26: Denmark, Finland
Oct. 17: Singapore
Oct. 19: Taiwan, Estonia

During the two weeks after the initial iMac introduction on Aug. 15, almost the entire supply of iMacs from the Sacramento and Singapore facilities were directed to the U.S. market. Beginning with Japan in late August, iMacs produced from the Singapore facility were gradually diverted to other countries.

Since the InfoBead survey covered only the U.S. retail market, one would expect to see a drop in September volume. After all, during August all iMac production was dedicated to the U.S. market to fill back orders; September production was diverted to reach international markets. Goldberg's logic in using the 20,000-units-per-week rate in August as the benchmark to measure future iMac demand just doesn't hold up under scrutiny.

Suppose a trendy restaurant just opened. On its first day of business a small crowd gathers outside, and at 11 a.m. the doors open and people crowd inside. If the number of customers that walked through the door during the first 10 minutes was twice as many as the following 10 minutes, could one conclude that the restaurant isn't as popular as once thought or that the signature dish -- foie gras a l�iMac -- didn't quite live up to expectation? Certainly not.

Apple's quarterly unit shipment prior to the iMac's introduction had been averaging about 650,000 units. That roughly translates to 12,500 units per week for the U.S. retail channel. Keep in mind that the 12,500 includes Apple's entire product line -- everything from G3 desktops to PowerBooks. For Goldberg to expect a single product to sustain a 20,000-per-week volume in the U.S. retail market is absurd.

My current quarterly estimate of total unit shipment is about 960,000 units, with 500,000 of them being iMacs. Analyst Lou Mazzucchelli of Gerald Klauer Mattison & Co. also expects more than 550,000 iMacs to be shipped for the quarter. If Apple meets these numbers I expect the company to report knockout earnings in January. With the strong Christmas buying season still ahead, Apple is definitely on track to deliver those numbers.

Goldberg is known for his cynical views about Apple. While critical thinking is a positive trait for market analysts, skepticism is not.

In early June, Goldberg speculated that Apple may have practiced "channel stuffing" in order to manufacture profits, but the accusation made little sense. The company's increasing gross margin, decreasing in-house inventory and growing profit all conflicted with Goldberg's negative portrayal, and it was later shown to be unfounded.

Companies generally resort to channel stuffing only when they have difficulty meeting earnings estimates. Channel stuffing may boost profit in one quarter, but those who play this trick end up paying the price in subsequent quarters. Apple had already blown away consensus estimate for two consecutive quarters; if they were the result of channel stuffing, it clearly would have been overkill. Apple has since delivered two more profitable quarters, beating consensus estimates by 52 percent in the third quarter and 39 percent in the fourth. In conference calls with analysts, Apple plainly stated that channel inventory remained flat in terms of unit volume and continues to decrease in terms of value.

It just goes to show that no writer or analyst is infallible.

Independent financial analyst Eric Yang can be reached via e-mail at ericy@macevolution.com

There ya go. I mean, just think about it. At one point Atari had a workstation class machine (The Transputor ATW800) running a version of Unix, Hellios (sp?), capable of supporting multiple processors (up to 13!),

while Commodore had a very fast A3000 model with a DSP (and much more)
that neither company released. What were they thinking? "oh, can't do
that-these machines are too far ahead of their time!". Duh. The "what-ifs"
could literally drive you crazy thinking about it... ;-)

Anybody else read the Computer Shopper? (I use it to find hardware bargains
for my Atari systems!). Anyways, one of my favorite columns is "The Hard
Edge". This month, Bill and Alice list the Top Events of the last 20 years.

The Atari 800 made the list... ;-)))))

PS The Macintosh made the list, but it also made the list of the worst 20
events, as well as Steve Jobs returning to Apple...Hehehehehehehehe...!

it's an Atari clone that appeared in Europe a few years ago - based around a TT architecture, it's available in 040 and 060 Motorola configurations. Some companies in Europe are selling it configured so it can run Atari versions of Cubase Audio REALLY fast :) And yes, despite TIFKAS' overblown claims to the contrary, it's a really nice, rock-steady, stable computer.

are you, like everyone in comp.sys.mac.advocacy, sick of TIFKAS' jingoistic MCIBTYC rants? Would you like to find out about Mac issues from a clear, rational group of Mac users who aren't afraid to pull punches on what they find about their hardware, their software, their take on where Apple is going?

Well, I found this great site called MacOpinion. And, I am quite impressed - these guys have respect for other platforms and smarts, unlike TIFKAS, who seems to have an agenda all his own against all Atari users, and doing it badly.

Here's an example - an excellent article by a MacOpinion reader on the way the Mac should be promoted to other people. His "don't" examples sound like one particular person we all know......

Oh yes, the address...http://macopinion.com

Think Different - Not Better

October 01 1998
by Rich Locasso

Contributing Reader

As a new Mac owner, about a year now, I have concluded that the most difficult aspect of owning a Mac, by far, hands down, is the constant diet of obsessive, quasi-fanatical, and often irrational and sometimes immature behavior of Mac supporters in favor of their computer and against the PC platform. How any sane and normal Mac owner can keep peace of mind with this constant diet of irrational exuberance year after year escapes me.

The brouhaha over the recent iMac verses PC benchmark test results from PC Magazine is a case in point. The tests clearly showed that in a variety of different real life application programs, the Pentium outperformed the iMac. Simply stated, the testing showed that a 450 MHz Pentium II was a little to a whole lot faster than an iMac, depending on the task.

Judging by the response of many Mac supporters to this article, one would think that the world was ending in seven days! Why it was as if the Gods themselves had conspired with Bill Gates and PC Magazine to make absolutely everything about the article, the test methodology, and the results unfair, invalid and a total affront to all Mac owners. It's an insult, an outrage, and another example of PC lies! One Evangelist subscriber even intoned how "unfair" it was to pit a humble iMac against a Big (and presumably mean) 450MHz Pentium II. Beating up a little iMac like that!

Well, wake up Mac owners. Did you think Steve Jobs had as his objective truth in advertising? Do you think Apple chose the Byte benchmark for Mac/PC comparison testing because it was a fair and honest index? Have you been lead down the way by the blinders of group think so strong in MacLand that you find it impossible to think and see the impossible?

The results did not surprise me. Indeed, MacAddict Magazine, in the March, 1998, issue, page 54, found similar results. Using a bench mark made up of 17 different functions from Adobe Photoshop, a Mac 7600/120 poked through in 4 minutes, 1 second, a 266MHz G3 in 1 minute 40 seconds, and a 333MHz Pentium II in 1 minute 25 seconds.

As a naive new Mac owner, I posted these results in the Apple Technical Forum and asked if anyone could explain them in light of Apple's assertion that the G3 was up to twice as fast as the Pentium. Well, no one could and people just sort of ignored it. I got the feeling that the MacAddict article was like a dirty little secret that no one wanted to talk about or acknowledge.

So I sent similar inquiries to Evangelist, asking if the Gurus there could account for these results. And not too surprising, the submission was not printed. Nothing ever appears in Evangelist which presents the Mac as inferior to the PC or suggests that the Mac is anything less than superior. No wonder the average Mac user after unending bias of this sort is bewitched, bothered and bewildered.

Advocacy and objectivity are perhaps like oil and water. And this attitude of superiority is found as a subtle and insidious part of most of the Mac web sites. It goes hand in hand with "enthusiasm" - it is a scourge that covers the earth, creeping and seeping over everything like the tomatoes that ate Cleveland. It's as if the implicit credo of the Macintosh supporter is that as much as we try to be humble, we just have to admit, we are superior. It's just the way we are.

Well, I have a very important message for all Mac zealots and advocates regarding your attitude. The message is a sincere one, designed to free you and help you excel. It comes with strong underpinnings from both spiritual practice and the mental health profession. Read it, learn it, believe it.

You Don't Have To Be Better - It's Ok Just To Be Different.

This message serves individuals well as they struggle with personal growth and life's challenges, and often provides the spark for a turn in adjustment in a new and healthier direction. It will do the same for the Mac community.

The basic idea is this: It's okay to like or love something or someone for what they are. They do not have to be better than everyone else in all categories. They do not have to be perfect. The Mac does not have to be wonderful and superior. And it is no reflection on us to love something that is not the best. We love it for what it is, just the way it is, and that is just fine.

When you think this way, you are freed from duress. You find it unimportant if something or someone else can do better or be more effective or be the best. You are content to know yourself and know what you prefer and to make the choice and be comfortable with it. And you can respect and applaud all others for what they are and what unique or different things they may do, things that make them what they are. You are not threatened by them but rather you can reach out and celebrate them too.

When Mac owners can accept the PC as a marvelous and worthy platform, which it is, and accept their Macs as marvelous and wonderful computers which are simply different, things will be good. We can still work together to make the Mac more productive and to help each other with all the challenges we have. This will never end. But we will waste no more energy on non-productive hate and anger, which is basically what these feelings involve. So much energy currently goes in this direction!

Demonstrating superiority separates, and it dissipates our energy without producing anything of value in return.

I truly believe that if Mac owners forgot about the PC and focused their talents solely on Mac issues, things would be much more pleasant, owners would be happier, and far more progress would be made. And we might find that we would attract more PC users with honey and an honest commitment to help, rather than with what too often appears to them as an elitist and condescending attitude. And we certainly would end the petty and immature banter that currently seasons a lot of Mac dialogue.

So to all Mac owners, may I propose that as Apple continues down a new pathway, that we chose a new pathway as well. Let our new path be this:

THINK DIFFERENT, NOT BETTER.

Accept the above wisdom and be free from the anger that you feel toward all things different from the Mac. No longer be threatened by software, hardware or company presidents outside of the Mac fold. Accept the relief of not having to defend the Mac endlessly, with blind belief in its superiority.

And most importantly, devote your substantial energies and talents toward the wonderful task of continually improving the Mac, working with others who prefer the Mac, and making the Mac do what is important to you in the best way possible.

I sent a letter with the above message to the Evangelist, that bastion of Mac bias and emotionality. That it did not see the light of day was no surprise. Thinking different, not better, is the antithesis of the Evangelist charter. And the Evangelist charter and its implicit clones around the internet is indeed the heart of the problem.

The Mac community needs to gain adulthood. It is time for a change. We all need to begin to lead the way toward a new and far more mature and forward-looking perspective. As a society we have come a long way toward the ethic of equality. We are becoming much more comfortable with diversity and learning how to accept and celebrate the differences between people and cultures. Life becomes much easier as our sense of community becomes larger.

Well, if we can do this with religions, races and cultures, we can do it with computers too. It is time for the Mac community to eliminate this onerous attitude of superiority, bias and prejudice once and for all. Replace it with an honest respect for other computer and the people who own them, showing grace and class all the way.

That will be a breath of fresh air. It will happen, it is coming. Respect the PC for the wonderful platform that it is, learn from it, grow with it, and yet support and prefer the Mac.

Think Different, Not Better. Relax and enjoy the journey.

>strong. Ducking now...

funny why they're not discussing this in comp.sys.mac.advocacy - maybe they don't trust any sort of knee-jerk reactions from MacWeak. Maybe, after changing your knappies, you could post that over there and have it properly debunked. But like I said, you have a reputation not only for getting it wrong, but not double-checking before posting a press release or article.....

Ducking is the wrong move when you're getting your butt kicked in cyberspace :)

>>   looking forward to your reply in alt.usenet.kooks.......

<lD742.324$956.465467@news3.mia>...

> The Tramiels acquired a very crippled company. Their retail channel was blown up before the tramiels got to Atari. What's amazing is that the Tramiels kept Atari going for another 10 years. Atari's mistake was to merge with JTS, what a waste of 45 million dollars. Before the merger, Atari was actually in pretty good shape, and could have become a very successful clone manufacturer. The profits and revenues from making clones could have subsidized Atari's R&D. 1995 was a very bad year for any computer maker who did not use WIN 95. No small company could have survived a multibillion dollar advertising and promotional blitz like that. Atari did however have a huge portfolio of patents, 45 mil in cash and only 42 mil in debt. Financially they were in good shape. Tramiel gambled that Tom Mitchel could turn the company back into a fortune 500 company. Unfortunately JTS started about 1 1/2 years to late. Commodore on the other hand was a complete mess financially and could not continue. All debt and no revenues and no cash will always kill a company.
>

It's not a lack of revenue that killed Commodore, but the pricks at the top feeding their fat wallets for all that it was worth.
There was a rumour at the time that another company actually paid the C= management big dollars to run the company into the ground.
If such a rumour was indeed fact, it wouldn't be too hard to figure out who that company was...

Regards,

Clockmeister.

The Hades is a yesterday decade computer design using a yester decade
processer technology and yester decade Operating system called TOS. You
can't even use DVD, IE and Netscape as browsers. Plus the price is will set
you back to mars

<<snipped a whole lot of tifkas propaganda>>

Regarding the 040....

Give me ONE reason why a 040 is insufficient, especially on an Atari platform, while it can easily do the tasks that PC's need a Pentium for?

Compare:
-funcitonality
-memory requirements
-processor requirements

Ataris don't need a multi-terabyte operating system with gigabyte application software and dito documents. We can do exactly the same with a lot less in the same amount of time.

At least for our platform, there are still good, imaginative, creative programmers. On the Wintel show, there's many a instant-app builder with the likes of Visual Basic and Visual C, using the same huge library of bugs - sorry - features... that M$ brought upon them and taking it for granted, resulting in equally unstable and sluggish performance as M$'s, at least compared to what their app AND the O.S. its running on should be supposed to be capable of, given the relative power of the available hardware. How much is put to good use?

Why do you think that the creators of the old MM100, the PC version of the excellent multimedia app "Scala" on the Amiga, decided to bypass any and all O.S. altogether?

'nuff said :-)

Who is this dude? Who said Mac users could have brains? No I'm only
kidding - I have a Mac (please don't beat me...:)) and it's pretty good.

Not especially fast, but certainly a more intuitive approach as far as the OS goes. The hardware's put together pretty well, too.

That said, there's nothing quite like having a comparatively simple machine like the ST. A decent ST programmer can know all of the calls in the OS - compare that to more than 8000 (that's eight thousand!!!!!) in the MacOS toolbox.

Computers, as a rule, get slower when they're more complex. Take the PC as an example - MS Word, running under DOS, is far quicker than Word running under Windows (assuming they're run on the same machine of course). The ST (and computer like the Amiga and Acorn Archimedes) are faster 'cos they're leaner - less unnecessary crap to eat away at processing power. If the Mac or the PC had operating systems that were written well (ie more like TOS or Unix) they'd scream along. As it is, my hard disc-equipped 75 MHz Mac 7200 takes LONGER to boot with Mac OS 8.0, with only 10 extensions enabled, than my old floppy drive 4Mb 1040STe (and that's loading SuperBoot, about 6 patches and extensions, around 10 DAs AND a replacement Desktop shell)...

That's another thing - maybe I'm looking in the wrong places, but it seems to me that the simpler systems encourage more experimentation on the part of programmers. I used to look forward to each issue of ST User, to see what new patches and utilities were on the coverdisc. People used to rewrite parts of the OS!!!! These, as ST users will be aware, were usually assembly-language implementations of OS routines such as FPPATCH, which sped up printing by actually getting bytes to the port quicker. Or Chameleon, which allowed the user to dynamically load DAs.

Whew! that's enough from me - enjoy your machines and remember: It's not necessarily the hardware - usually it's the shoddily-written software that;s slowing you down.

In 1992 their slaes were about $80 million USD. If they were only a software company, they may have been able to survive. But they made Hardware and $80mil should be their profit , not their sales. Not that Atari did any better, but Atari was a little more diverse with their products, ie prtfolio, st series, lynx, jaquar, and as I recently found out, PC clones.

BTW, have you ever heard of a commodore PC clone called the COLT, they used to sell these at service merchandise in the US.

Anyway, in 1992, 1993 in order for any alternative computer platform to compete against the Intel/Microsoft machine that was begginning to steamroll, they would have needed a lot of money to release a new and better machine every six months. The release of windows 95 with a billion dollar ad campaign would have sealed the coffin regardless.

As with all things business, the 16 bit computers took over the 8 bitters and win 95 (32 bit) took over the 16 bitters, I wonder who will be the leader in a few years when 64 bit platforms are common.

Will it be LINUX?
Will it be TOS?
Will it be AmigaOS?
Will CP/M come back?
or will Windows 2000 rule?

The HADES has a 060 option. TOS computers have can easily be connected to the WEB using STing, CAB, Draconis/Adamas or Wensuite. These are all currently being sopported. The HADES is taking TOS and putting it into the configuration that Atari should have in the first place, a modular design. Have you ever run optimized 68000 code on a 68060 processor.

The HADES may be a bit on the expensive side, but if you got a better job, than the price should not matter. It's only expensive, because you can't afford it.

You can also install mint and linux on it.

You can use any standard IDE and SCSI device on it.

As far as DVD, why would you want to watch movies on a computer, tha't what a TV is for. I'd rather watch a movie on a 40 inch TV than a 17 inch monitor. That is unless you are one of those nerds who like to look at porno on the computer, in that case, get a life, a job and a girlfriend

A1000, A500, A600, A1200, A2000,A1500, A2500, A2500UX, A3000, A4000, CD32, CDTV,
C128, C64, C16, Plus4, the VIC, PET range and all the numerous PC clones
ranging from XT to 486+ compats.

Quite a diverse range really.

> BTW, have you ever heard of a commodore PC clone called the COLT, they
> used to sell these at service merchandise in the US.

Commodore sold PC from the beginning, most of them manufactured by C=.

From the early XT all the way to the last 486's. In fact, Tulip in Europe
own the C= trademark now and are still selling brand new PC's with the same
C= logo on them.

Really?. That would explain why so many people are defecting to Linux and
other OS's I guess. I don't agree with you here... MS won by default, and
that IS the hard reality. Mac OS was and is NEVER going to be a serious
challenger to Wintel dominance, because Apples products are weak.

> As with all things business, the 16 bit computers took over the 8

Amigas are 32 bit, although the 68000 had a 16bit external bus, it can
still be considered a 32bit processor. Same for the Atari.
Don't forget the many 68020+ full 32 bit machines C= sold as well.
AmigaOS has always been a 32bit OS, and Windows95/98 is a 16bit OS with
some 32 bit support. You do realize that right?.

BeOS Big potential, also heavily influenced by AmigaOS.
QNX   The future Amiga OS kernel, and it is fantastic.

Have you tried the QNX demo?.

A Swiss Atari TT clone, based on either a 68040 or a 68060.
In North America, it is sold under the name of "DirecTT".

Those are the silliest arguments I have seen in a long time. Does the
unavailability of a certain web browser make a machine useless? Peter, you
really are a bigger fool than I had thought.

Besides, the OSes of the Hades are more advanced than the MacOS, which still
doesn't multitask. You haven't even run a Hades, Peter, you have no idea what
you are talking about.

And as for the rest of the technology, most of it is based on a fast
architecture and standard PCI components.

And the price is not that bad, I quoted prices earlier this summer which were
acceptable. If those are not to your liking, choose a cheaper platform such as
the Milan.

And you obviously haven't used MacOS. It certainly does multitask, considering that I'm downloading a file in Netscape, writing this, Claris Emailer is checking for mail, and if I wanted to I could be copying a number of files in the Finder, downloading other files in Netscape, applying Photoshop filters, stuffing and unstuffing files, and just abotu anything else at the same time. Sure, it's cooperative multitasking, but it is multitasking, and it works perfectly fine in all but a few rare instances.

AND why is it so hard for Apple to get pre-emptive multi-tasking? (which is
superior) I mean, the Amiga and Unix have had it since the beginning of
time, and Atari users have multiple pre-emptive multitasking systems. (eg
Mint and MagiC) Doesn't Apple have qualified software engineers? (this is
not a snide remark-I just can't help but wonder!) Or is there some hardware
or software (OS) related reason why it can't be/won't be done on the Mac?

Thanks...

>The Hades is a yesterday decade computer design using a yester decade
>processer technology and yester decade Operating system called TOS. You
>can't even use DVD, IE and Netscape as browsers. Plus the price is will set
>you back to mars

hmmm, let's take this apart bit by bit:

"The Hades is a yesterday decade computer design".....

hmm - tower case, 4 PCI slots, 2 ISA slots, 1 VME slot, IDE interface, SCSI interface, can handle up to 1 gigabyte of RAM, Printer port, 2 modem ports, lan port, mouse, keyboard and joystick ports. Sounds pretty 1990s and up-to-date to me.

"using a yester decade processer technology"......

again, TIFKAS gets it wrong. The Hades comes either with a Motorola 68040 or 68060 processor - and both chips were introduced in the mid 1990s (indeed, the LC475 and LC575, and the Quadras, utilizes 68040 processors - by his own yardstick, TIFKAS has said that these fine computers are junk and not worth your attention). These chips, when combined with an Atari operating system, go like stink, because they don't have to deal with the bloated, multi-megabyte operating systems Apple has foisted upon their users. Speaking of which.....

"and yester decade Operating system called TOS."

BZZZT! WRONG! The TOS found in the Hades is based around a modified TOS 3, the operating system found in Atari's TT030, a highly-prized computer for any Atari user (BTW, it came out in 1991, which makes it part of THIS decade). TIFKAS bases his opinions on his playing with an original 520ST with TOS 1 a grand total of ONCE ("shades of GEOS if you ask me", he sniffed). TOS 3 features, among other things, the ability to have icons on the desktop for launching programs, the ability to assign icons to particular files and programs, keyboard macros and shortcuts. (as an aside, the Falcon's TOS - TOS 4 - came out in 1992, still within this decade).

Want to add a more up-to-date operating system? No problem! There's NaES/MinT, which can add a nice multi-tasking system that can also allow you to utilize a variety of programs ported from UNIX. ASH now makes a version of their popular MagiC operating system that runs on the Hades, and which allows you to congfigure it with a host of powerful features, as well as a group of neat utilities and applications that give you the best of the Windows and Mac enviroments. You can install Linux on this box and make use of the many utilities, applications and drivers this programming community has been cranking out.

By the way, the above alternate operating systems feature true pre-emptive multitasking - an ability that no Macintosh will be able to lay claim to, at least until Mac OSX comes out (and then it'll only work on G3 Macintoshes like the overpriced, underpowered iMac) (of course, Steve Jobs has already insured the need to upgrade your Mac hardware by making sure Mac OS 8.5 will not run on '040-based Macs - kin you say "ORPHAN", boys and girls?).

"You can't even use DVD, IE and Netscape as browsers".

First off, you can't use DVD as a browser on a Mac, either, or on a PC or Amiga! With logic like that, TIFKAS, you'll become a janitor in no time! :)

DVD? Maybe in the near future - when an acceptable cross-platform standard emerges. One thing about Atari users, they get great glee out proving mouth-breathing throwbacks from a primordial swamp like TIFKAS wrong.

Netscape? No problem - just run Linux, compile, serve.

IE4? One big advantage of being an Atari user is being able to sleep at night knowing that none of your money has gone to Billionaire Bill, who has used his wealth and unfair advantage in the market to crush, threaten and bully all who dare to compete against him, including (gasp!) Intel and (GASP!) Apple (speaking of which, wonderful smoke-screen Jobs and Gates gave regarding the $150M "confidence" payment after Gates threatened to crush Apple like a bug by withholding development, eh TIFKAS? Hopefully Jobs cut a deal with the DoJ to go state's evidence against Gates......).

Internet clients? No problem - there's CAB, NEWsie, Light Of Adamas, Draconis, Okami, POPwatch, NEWSwatch, MyMail, aFTP, POPmail, AtarIRC, FracIRC, Wensuite....and the TCP/IP stacks like STiK, STiNG (highly recommended), and PPPConnect. All of which runs happily on a Hades (and many of these run happily on even the lowliest 1-megabyte ST).

"Plus the price is will set you back to mars"

TIFKAS' brain is still on Pluto. While a complete Hades system is still up there, you CAN reduce the price by buying a motherboard from your Hades dealer and then assembling the rest of the components (graphics cards, RAM, drives, etc) to reduce the price. But I think now with the cheaper '040-based Milan (which has apparently proven to be a big hit in Europe) out there providing healthy competition, we could expect to see some of those prices go down.

BTW, there's an excellent series about the Hades written by Edward S. Baiz, a long-time Atari users from Indiana, that's running in the ST+ fanzine - you can check out this wonderful non-profit Atari resource at http://www.users.zetnet.co.uk/paxton/stp/index.html .

Or even better, why not get it straight from the horse's mouth, and not out of the mouths of whiny little troglodyte disinformationists like TIFKAS?

http://www.ee.ethz.ch/~caschwan/medusa.html

or for the Milan?

http://www.milan-computer.de/html_gb/index2.html

One thing is for certain - with the above screed, TIFKAS has committed another of his classic gaffs, which rates right up there with "Calamus Is Crap, and though I've never used it I've heard enough to comment about it", "90% of all TOS applications fall over on the Milan", "Atari Internet clients are inadequate", "I only state the facts".... Why trust a man who insists on talking to his imaginary friend, "Chunks", constantly tries to rewrite history about his abuse of the Internet against imaginary "Atari Jihads" who are "out to get him and the Mac", and who has proven that George Santayana's noting a fanatic is someone who's redoubled his efforts when he's forgotten what his primary goal was (as in Wile E. Coyote) is quite true? Indeed, who has wasted much of his entire adult life hassling a minority group of a still-popular computer platform who are still happy and productive using a wonderful operating system and applications by telling half-truths and lies about said system ,and heaping abuse upon them when he is corrected by them. What a sad little life you indeed lead, TIFKAS - and I still suggest you see a psychiatrist and sort out your deep-seated anger and face your fears and inadequacies before it's too late.....

They have to have a sales argument for the next version of MacOS. The
next MacOS version will have real multitasking! No, the next after
that! No, wait..

Prove it. Post a manned phone number for your direct supervisor. I
will call and verify this and let the others know.........

By the by, even with the threat of Apple bringing a lawsuit aginst the
Navy for dropping Macs, they (the Navy) continues to go full speed
ahead purchasing PC compatible machines for support now and into the
future. Something that Apple can't promise.

Very little, I would think. Atari and Commodore had many strong points but the message never really got out. Now, if Atari and Commodore had merged, and then Time-Warner had decided to acquire them, there may have been a significant difference. Even with all of the mis-steps that Warner Communications made, they had _enormous_ marketing clout (not to mention the ability to put the Commodore & Atari machines & logos into their motion pictures). I think if C & A had merged that the platforms might still be viable, but whatever their merits, wouldn't have gained a large market share among the general populous (as opposed to discerning consumers) without the company being willing to put some money up front first and foremost for advertising, secondly, and nearly as important, actually producing enough machines to fulfill the demand (I personally know *many* people that would have loved to have become part of the ST community, but couldn't simply because Atari didn't make the machines available in the US, so they went on to Wintel boxes). I would see a merged Atari & Commodore against PCs & Macs kind of like RC Cola against Coke & Pepsi - still hanging in, but very distantly.

Yea right...I imagine all these rabid Jihads call at the same time...Not a

chance... Guys and gals we are all busy keeping up with Apple in Comp.
If
you want to say hi, I will be at Comp next friday - Sun at in Clive, Iowa.
But will be at the Bloomington, Roseville, Minnetonka and Woodbury stores
earlier in the week.

The truth isn't out there, it's right here! Well spoken, Daniel. Finally an
intelligent post as opposed to you-know-who's Apple-ad press releases.

There is one thing that does concern me though. Although things are from the
1990's, the features mentioned for the Hades hardly seem truly 90's
development. Perhaps TIFKAS was refering to USB, DVD, Ultra ATA, Fibre
Channel and Gigabit ethernet. But then again, the 8-bit Ataris did have - to
some extend - their own USB in the early 80's. But then again, give me a
reason why an Atari user would NEED USB or Ultra ATA? How many pretty
contemptibles are true 90's machines (TIFKAS, may I remind you hat you're
90's Mac will be yester decade technology in less than 2 years... and Oh eh
BTW - does your iMac fishtank explode after 2000? our Ataris do not... ;-).
How many Macs are? (Really, very smart indeed, no means to get data into the

computer but a mouse, a keyboard and the Internet by default. That's a great way to swap and store stuff, especially with system crashes... and with Billy looking over Jobs' shoulder, you should expect a LOT of those)

Man.. even the most hyper-advanced pretty contemptible still has the basic IBM PC architecture and all the fancy hardware stuff you see today (PCI, AGP, EISA, etc, etc.) are desperate attempts to break their boundaries. Don't try to crank up the bus speed of the whole system... well ok, with VLB and PCI it sort of works, but it took a while for it being developed. New tech huh? I believe the C64 had a local bus. Commodore designed their own bus system, and so did Atari, and adapted it to VME, an industrial strength standard for years. Just like 70's technology of Unix-varieties BTW, still and the growing main choice for critical apps (can you say Linux) of professional and power users. As for operatiing systems... we happen to like an operating system that keeps your apps slick and swift. We only need 4MB to do EXACTLY the same that pretty contemptibles or perhaps even Macs can do with 32.... (this figure used to be 16, but with new "enhanced" O.S.'s [or should you say more overhead and built-in browsers...) go figure!). In fact, even the lowliest 512kB machine can still do a lot and has more mem available to apps than most PC's running old MS-DOS versions... speaking of which... there's only ONE 32-bit Windows O.S. and that's NT (you know, the nice try variety). Oh and yes, OS/2, a lot more stable, IMHO. Copland, Win95, Win98, or even Win2000 are all still 16-bit, with the Gates-varieties still with a MS-DOS kernel.

Reminds me of 2-decade ago technology, doesn't it, TIFKAS?

Oh well. We're happy where we are. It seems that you're not. Why bother us then? Buy an Atari and you'll be happy too! :-))

Back In Time, a web site dedicated to all Atari games and computers, has recently expanded, and moved to a new web host at http://www.emuclassics.com/backintime.

The site has information on all Atari game consoles including the 2600, 5200, 7800, Lynx, Jaguar, Pong, etc. Atari computers are covered extensively. Those systems include the 400/800, XL, XE, ST, TT, and Falcon series. Other Atari devices, such as the Hotz Box, are covered. Up to date news on the Atari scene is included. Emulation of these systems on the PC platform, along with arcade emulators, is included. The site also looks at some prototype and vaporware equipment.

The site is full of history and photos. Good Atari web sites are vanishing from the web. It is my intention to make my site a leader in Atari coverage. If you love Atari, you will have to check out Back In Time

Plausible deniability.

Ellison was the one who told the world that Steve Jobs was going to kick out Gil Amelio and take over Apple and put Ellison on the BoD. Jobs denied the claim, of course.

OTOH, Jobs answered a question at the last Apple stockholder's meeting about a $500 MacOS machine by saying "ask me next year."

How do you figure?
The imac is the consumer desktop, the consumer portable is PI, a g3 with a passive matrix screen, and rumored to be in the $1000 and $1200 range.

while watching the news Sunday night, I saw a report on the Apple iMac - and a rather interesting bit of news that I'm not sure that anybody has commented on yet.

Apparently Larry Ellison was at a computer conference this weekend and made an announcement that sometime in early 1999 a new iMac model will be introduced that will even be more affordable.

Now here's the kicker - Ellison was quoted as saying that this new iMac will retail around a ballpark figure of $500 US.

Now THIS is quite interesting - especially in light of the talk of sub-$600 PCs that are going to be released by Intel vendors.

Now - in order to pare $800 off this new iMac from the current one, what do you think may have to be eliminated? The Ethernet connector? Maybe no monitor (just buy an SVGA, plug it in and go?). I kind of doubt that they'll eliminate one USB connector....

This should prove interesting, especially to those in the Atari community - it may mean that we will have a VERY affordable platform to run MagiCMac on :)

I'm rather surprised, though, that it was Ellison and not Steve Jobs that made the announcement...

'Chunks' will be Popeye in no time...

As iMacs Thrive, Dealers Revive

(11/23/98, 2:08 p.m. ET)
By Todd Wasserman, Computer Retail Week

The success of the iMac that has propelled activity among Apple's smaller specialty retailers is eliciting inquiries from others who want a piece of the company's turnabout.

"We're getting an awful lot of requests, and quite frankly, we're turning down some and putting others on hold," said Jeff Hanson, Apple's senior director of channel sales.

Expanding its channel presence would cap a successful, almost year-long program in which Apple pared several national retailers and three distributors. Last month, the Cupertino, Calif., company added Best Buy as its third national account, joining CompUSA and Micro Center.

Apple's iMac, introduced in August, boosted the company's share of the PC market to 11.7 percent in October, vs. 7.6 percent in October 1997, according to PC Data, in Reston, Va.

Apple is also considering a sub-$1,000 unit, Hanson said. "I think we'd be remiss if we're going to be in the consumer market and not recognize there are certain price points we have to hit," he said.

While demand for the iMac and other products remains strong, Apple has proven to be atypically adept at providing products punctually, retailers said.

"It's been unusually good," said Tony Violanti, vice president of sales for ComputerTown, in Salem, N.H. "It seems like they have their act together."

"Apple has improved dramatically when it comes to forecasting product availability," said Mark Miller, director of sales, marketing and communication for MacCenter, in Fort Lauderdale, Fla.

Yet Miller and other Apple dealers said products such as high-end Macs and PowerBooks are still often in short supply.

Hanson said Apple struggled to meet demand on some products in mid-September. "We were constrained on some of the professional-line products and maybe even some of the PowerBooks, but in early October, that was resolved," he said.

"One of the biggest steps we took last year was to consolidate distribution so we had only two places where I try to manage inventory from," he said. Apple chose two distributors, Ingram Micro and Pinacor, from a group that also comprised Merisel, Tech Data, and Inacom.

In December 1997, Apple moved to a four-week price- protection policy. "In the past, it was pretty open. We'd price- protect [retailers'] on-hand inventory," he said. "The problem is, that allows an awful lot of slop in the way people manage inventory."

Yes, this isn't the first time Larry said Apple was going to do something
that later didn't happen.  Remember early in the year when he said they
were going to make a network computer with a 17" screen for under $1000?
Instead it was the iMac (which, while not having a 17" screen or being
under $1000, could still be called a network computer :).  And remember
when he was going to personally buy Apple and put Steve in charge?  Well,
that one was pretty close... ;)

>OTOH, Jobs answered a question at the last Apple stockholder's meeting

I thought it was sub-$1000 at the time?  I didn't think people were even
talking about sub-$500 PC's yet...I'm thinking of them meeting that took
place sometime before the May iMac announcement, was there a later one?

Actually, I believe that they were asking about a Newton-like system. It
was at the stockholder's meeting last January, as I recall.

No. Apple's next consumer portable (or P1) is slated to start at prices
around $1200 and be much more than a glorified eMate. Ellison would had
to have been talking about a new iMac or successor to the iMac.

Yup - should be great - now all we need is a 'MagicMac' version that
will run on OS 8.5 - and - be available for purchase in Canader !

Yes it was intended quite humorously :-)
As for what 32MB machines can do.... I'd just say this: you can buy a
bog-standard ST for sometimes less than $50 (ok, with 1MB). Try getting a
comparable PC for that. In stead of buying a PC, buy several ST's and
network them :-)) Get a 720k floppy disk with a shareware MIDI-app some DIN
cables and you can do MIDI sequencing (if that's what you want).

Anyway, what you said is all true, but I think you kind of missed the spirit
or intention of the post. :-)

The first Ataris will get problems around 2048 if I'm not mistaken. And the
2000 problem was not with regard to Macs but with regard to many a PC
(pretty contemptible ;-)

This was a general post as a reply to Daniel's and was intended to be taken
with a tiny little bit of humor :)

C'ya

Sportsfans..

The Hades underperforms todays Pentium at higher cost. From the horses mouth
below..

I was told you were cutting down the Hades and saying
things about
subject you did not know anything about. Let me tell

you this, the
Hades 060 is one of the best computers I have ever
used. It is as fast
as a 200-300mhz Pentium and can do most anything. It
can have 1 gig of
memory, takes PCI card as well the older ISA cards. I
can do scanning,
DTP (I use Layout which is also made for the Mac),
get on the NET, get
email and more. As far as it being slow, it is not.
Please, the Mac you
run and sell is a fine piece of work. Stick with it.
Don't cut down
other machines, expecially those that are also a fine
piece of work.
I love my machine and there is nothing you can say to
make me ever
change my mind....

Interesting reading in the latest edition(Nov) of Next Generation. There is a interview article with Jim Whimms who helped launched Nintendo to stardom in 1986 and the Sony Playstation in 1995(to bad Atari did not hire him).

Much of the Atari alumni have taken shelter at VM Labs that is developing a new console called Project X. Will Project X suffer the painful death of the Jag? Well, Whimms think so. If this happens what happens to those ex Atari employese again. Working at another company that went down the toilet is not good for the resume.

This is what he has to say about VM Labs:

"project x....then your dreaming. To get into this marketplace, now that Sony is so entrenched, and with Nintendo with $5 billion in cash and no debt...- your looking at tough competition. We've always known that there is only room for one or two systems to succeed because you cannot compete with just 10% or 15% market share - the economic model just doesn't work this way. Ask Sega. All VM Labs has done is buy themselves a two year hall pass(132)."

Looks like those venture capitalists will have a nice tax write off.

Peter S.

I'm a bit surprised about what this guy says about X.

1. X is NOT a videogame-console in that sense.
It is basically a chip providing many "multimedia" operations,
and from these is most important the MPEG2-decoding.
It's not a standalone device, it's a *chip*.

2.   The plan seems to be to give X away to the consumer-electronics industry (licensed). VM Labs will NOT produce a games machine or anything else themselves.

3. The industry (e.g. Thompson) will produce units that have X inside (rather than intel inside ;-)). And I guess that this means DVD-players above all, maybe settop-boxes.

4. X can play games, too. But when Joe Sixpack buys his DVD-Player, he won't know or care. He will then discover that he can play games on his DVD-unit and *might* buy some.

5. Make your own guess how many people will have X in their homes when all VHS-Tapes are replaced by DVD, and how large the installed basis would be blahblahblah
There is not really much competition with Big N or Sony... It's *also* a console, but won't be sold as one.

6. _MY_ guess: X will be successful moneymaking-wise, but will fail as games-platform. Jeff Minter is cool and everything, but T3K just isn't enough.   * * *

This is what I've heard, corrections and opinions are always appreciated. Look at Thompsons Website, their DVD/whoknowswhat - player is called Blackbird (I think).

---> I'd just *love* to play T3K, though ....!

I saw a screenshot of IS3 on a site that also had pics of the gamepad
 and set top boxes by Motorola and Toshiba. It even had a list of
 companies who have agreed to make games. I don't remember the site but
 I think I got to it through a Jaguar site. I think this was the one.

I recieved email some time ago that IS would come to PC. Haven't seen
anything yet.

Bill

     Any possibility that MilanTOS will ever support UDI or
     just plain Linux/FreeBSD drivers? That could widen it's
     hardware support to beyond what's available for Petey's
     pet machine.

     ...just so long as the Milan people release their source
     if they derive from any of ours...

I know a of at least one existing computer company that openly
invested in another sinking company not to long ago...... And a few
game manufactures too....

Does the fact they were once Atari employees, and worked on a failed
project, make them undesireable? I think that would just about elimate
all the politicians in the U.S.

By the way, how many failed projects have you been involved in,
Sinplop? Every erection you've had?

 since Milan is also using nAESw/MiNT also, it would not be too
difficult(?) to port
from the 68k port of LiNUX/BSD to MiNT?? and use it under nAES/MiNT??
(rather than Milan TOS, which is 4.5, non? [Aren't they working on
5.0?])

     The fact that GEM was coded in fairly portable C
     was one aspect I always found endearing about it.
     It's a shame the intel version could never take off.

I've crossposted this to every newsgroup I could find that covers the major
micros of the 80's and early 90's - hopefully this thread won't turn into a
"my computer is better than yours" argument...

Anyway, here's what I'm after: what happened to the original artists behind
things like magazine covers, game adverts, game box covers, etc? And (and
here's what I'm REALLY after) what's happened with the original artwork? I
know that Bob Wakelin has sold his work, what about the others?

I'm also after Oli Frey to this end. Can anyone help?

Oh my god. I've been away for a while and this you-know-who is still
trolling this Atari group? If the Mac's so superior, what's he doing here?
Hoping to convert us all?

Good luck!

```

Subj : TAF Flea Market November 18th, 1998.

WEDSNDAY, NOVEMBER 18TH, 1998 is the date for another popular Toronto Atari Federation FLEA MARKET! The doors open to the Public at 7:00 PM and runs to 10:30 PM.

Yes, here's your chance to come to a bazaar of Atari-related software and hardware where you can shop for that peripheral or application for your ST/TT/Falcon or 8-bit that you've been looking for. Or, if there's stuff that you have no use for, get yourself a table and sell! Get rid of your old stuff or find yourself a treasure!

A Half-Table costs just $5.00, Full-Table just $10.00 each. A Half-Table is FREE to TAF MEMBERS. (Dealers are expected to contribute a little more <grin>), with entry to the Flea Market at $2.00 per family (Free to TAF Members).

The Flea Market itself will run from 7:00-10:30 PM (with setup commencing after 6:00 PM and teardown at 10:30PM). This should allow enough time for as many people inside and outside Toronto to show up.

As usual, piracy cannot and will not be condoned at a TAF Flea Market - anyone caught selling pirated software or stolen hardware will be dealt with severely!

Please refer to the bottom of this document regarding getting
in touch with TAF on booking tables or finding the location
of the event - and we'll see you there!

The TORONTO ATARI FEDERATION Flea Market will be held in the
Gold Room of the North York Memorial Community Hall on the
Lower (or Concourse) Level of the North York City Centre
Library Building at 5110 Yonge Street at Parkhome Avenue.
Parking garage inside the complex next to the Novatel Hotel
Those using public transport can take the TTC's line to the
North York City Centre Station and walk through the tunnel
into the concourse, down to the food court, turn left and
find the Memorial Hall.

That's Wednsday, November 18th, 1998, 7:00-10:30 PM for the TAF FLEA
MARKET.

For Sale:

One Atari 520ST
Two Atari SF354 floppy drives
One Atari SC1224 color monitor
Two Atari SM124 monochrome monitors
One Astra SW2 monitor switchbox
One Atari mouse

All cables and accessories

Big box of Atari ST software on both single sided and double density disks

Several Atari ST technical and programming books from Abacus

ALSO included is an Atari 1040ST that is presently not working, but I just believe it needs a new floppy drive.

Best offer with shipping takes all

I'm still primed to get debate going here. Whadaya wanna talk about - possibility of whether something like Sherlock for Apple OS 8.5 could be cloned for Atari? The good news about how well the Milan has been received in Europe?

>And no Post Scriptum ;-), I'm not asking YOU.

ah, let TIFKAS (The Idiot Forever Known As Sinclap) in on the party - everyone knows a clown is funniest when his pratfalls are unintentional :)

Is it me, or do you get the idea that whenever TIFKAS posts here, you get the mental image of him parading down main street in broad daylight with his pants around his ankles? :) Like his recent pathetic attempt to disrupt the newsgroup with his rantings about Project X and the former Atarians working on it - guess TIFKAS still hasn't forgiven Jeff Minter for calling him a w*nker, a tosspot and a t*rd.

Some thing to read about......
For info only, don't flame me.

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

Apple executive paints grim picture of deal with Microsoft
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

SOURCE: The Seattle Times, Washington

DATE: Monday, November 2, 1998

The Seattle Times, Washington via NewsEdge Corporation : WASHINGTON _ When Microsoft's $150 million investment in Apple Computer was announced with fanfare at a trade show in Boston last year, the software companies heralded the deal as a grand partnership, a win-win for the longtime rivals and a boon for Apple customers who counted on using Microsoft software on their Macintosh computers.

But now, in the government's antitrust lawsuit against Microsoft, Apple is prepared to offer a far more sinister view of the deal.

In written testimony scheduled to be unsealed in U.S. District Court this week or next, sources say an Apple official has charged that Microsoft essentially extorted the agreement by holding the struggling company hostage, threatening to withdraw any support for Microsoft software that runs on Apple _ a potentially lethal blow to Apple's operating system.

Despite objections from key executives, Apple went along, and in return, agreed to give Microsoft's Web browser an edge over competitor Netscape by making Microsoft's Internet Explorer the default software on the Mac operating system and agreeing not to promote Netscape's browser. Browsers are used to view content on the World Wide Web.

Those are just the first in a series of new allegations made by Avadis Tevanian, senior vice president of software engineering for Apple, according to sources close to the case.

Tevanian's testimony reportedly includes charges that Microsoft tried in vain to divide the market for audio-video software with Apple; sabotaged Apple's audio-video software, QuickTime, so it didn't work well on computers running Microsoft's Internet browser; and used threats and exclusionary tactics to goad Internet-content providers and computer-makers into rejecting QuickTime.

However, when Microsoft cross-examines Tevanian next week, company attorneys will work to portray a different view of the talks with Apple. Microsoft says there was no attempt to divide the market _ instead, the companies merely talked about ways to share technology in the burgeoning multimedia-software market.

The top priority of the Apple-Microsoft talks was to settle a patent complaint Apple had lodged with Microsoft, said Microsoft spokesman Jim Cullinan. In the end, the resolution was a good deal for both _ a fact Microsoft multimedia manager Eric Engstrom plans to emphasize when he takes the stand for the defense.

During the trial this week, government lawyers entered into evidence a scrawled note obtained from Apple Computer. The note, written in 1997 before the deal was signed, confirmed that Microsoft had threatened to stop making the popular Office software for Macintosh computers. If Microsoft did that, Apple's Chief Financial Officer Fred Anderson wrote, ``we were dead'' _ implying that nobody would want to buy the computer if such popular software wouldn't run on it.

Anderson went on to say that Microsoft had offered a ``trading card,'' which was that the Redmond, Wash., giant would continue making Office for Macintosh if Apple agreed to feature Microsoft's browser on its computers, dropping Netscape. Apple was essentially banned from putting Netscape's browser on the Mac desktop, where it would be more easily accessible, Tevanian reportedly has testified. Apple had been important to Netscape: About one-quarter of the visitors to Netscape's Web site were reportedly Mac users.

The Department of Justice and 20 states say the allegations are at the heart of their landmark antitrust lawsuit against Microsoft . Prosecutors are accusing the company of monopolizing the software market for operating systems and attempting to extend that monopoly to additional areas of software, particularly Internet browsers, in an effort to squelch any attempt to develop a competing operating system.

The Microsoft-Apple deal was met with boos and jeers from anti-Microsoft Apple fans attending the MacWorld convention in August 1997
And it was opposed strongly within Apple, Tevanian is said to have testified. Those employees were troubled that the agreement would hurt competition in the browser market and ultimately in the market for operating systems.

But Apple felt it had no choice, Tevanian has told prosecutors.

Withdrawal of support would have had a devastating impact on Macintosh not only because it would hurt sales of the computer, but also because independent software vendors would question their investment in developing programs for Apple's operating system.

In the market-division attempts, Microsoft allegedly proposed that Apple stop selling software to broadcast video and audio over the Internet, restricting itself to the smaller market for audio-video editing tools.

Tevanian has told antitrust prosecutors that Microsoft repeatedly attempted to divide the audio-video market between April 1997 and June 1998.

The alleged collusion attempt bears a striking resemblance to allegations by Netscape that Microsoft attempted to divide the browser market.

When Apple rejected the proposal, Microsoft then attempted to use its market power to defeat Apple rather than compete fairly, Tevanian has told the court. The primary way Microsoft did that was by persuading other computer-industry companies to reject QuickTime.

The first example that Apple cites of dissuading a company from using QuickTime involves Compaq, one of Microsoft's closest partners among computer-makers.

In a pretrial deposition, Apple Worldwide Marketing Vice President Phil Schiller said he was told by Compaq product manager Eric Federman that the Texas computer-maker was eager to put QuickTime 3.0 on its Presario computers because it could play digital video disks that Microsoft's proprietary multimedia software would not play.

Apple and Compaq officials met at Compaq's Houston offices on March 12. Apple executives demonstrated QuickTime. They said it could be licensed on a royalty basis _ or for free.

Schiller said Compaq engineers at the meeting were excited about the offer, but marketing managers were resistant.

After the meeting, Schiller was approached by Steven Decker, procurement director for Compaq's Presario division. Schiller, in his deposition, testified that Decker told him: ``You have to understand what's going on here. They're very afraid of doing anything to upset Microsoft. We are very wary of bundling anything that would upset Microsoft because they touch us in so many places.''

A week after the March meeting, Compaq notified Apple that it would not license QuickTime 3.0.

Heddy Baker, a spokeswoman for Compaq, said she does not know why QuickTime was not included in the Presario. ``Compaq looks at a ton of things before it makes any decision,'' she said.

The second example of pressuring a company to stop using QuickTime involved Avid Technology, a Massachusetts video-editing-software company. Avid was offered a spot on Microsoft's Windows desktop as part of a new sales channel where independent vendors could sell software to Windows users. But the deal was contingent on Avid dropping QuickTime. Avid was eager to promote its Cinema software, which permits personal-computer users to edit home video on their computers.

In January, Avid's Executive Vice President Cliff Jenks told Schiller he was ``under tremendous pressure from Microsoft not to support QuickTime.'' When Jenks attempted to lobby for a spot on Microsoft's new sales channel, he reportedly was told by Microsoft, ``That's not good enough. You need to rip QuickTime out of your product if you want to be in this channel.''

Apple believes this threat led to Avid's decision to join Microsoft as a partner in Microsoft's new multimedia-editing format that competes with Apple's QuickTime.

I may not be very good at technical responses, but I think I do a good job of stiring the pot every now and then....

I can understand some view points of current loyal Apple O/S users. Generally they come with a past experience of what computers were suppose to be. It's to bad they became wrapped up in the Microsloth wars of what the O/S will be for the future.

The O/S of the future is here today for a lot of users. MiNT, N_AES as well as MagiC and the clones it operates on is by far the most user friendly and hardware powerful system you can mount on your hard disk. While Win and Mac O/S's provide several more advanced graphical features embeded in the system, the luxury does not come without fault. PC's require massive processing power and capacity just to carry out the simplest of functions, and the Mac O/S still suffers from incompatibilites. You would think that one or the other company could establish standards where hardware and software installation was not a demeaning factor of owing a machine of the future. But low and behold, even megar twelve year old TOS machines share most of the capability of these new machines.

Current and future TOS clones, with the aid of the available bright programmers that currently hold interest in this market will soon step even beyond the current graphical ability of the other two sets. And once again, we will in ten years be saying, jezzz, we have had that for years.

Image that..........

Oh dear. A terrible thing occurred to me. What if MS refuses further developement of it's extraordinary-it's-a-must-to-use Word program on the Atari platform unless we all install Internet Exploder on our machines? Do we have to settle for Papyrus? What a grim future...

Markku

Is this really fun to you? I understand why the Atari fanatics do it.. but why do you? Choice of computer is just choice of tool.. what do you care what tool someone else uses?

You only seem to make yourself look silly by posting.. do you have nothing better to do then argue about someone else's choice of computer? Does it somehow make you feel better because you have a 'better' computer? Does it make you feel more valid? More of a man? Is your life so lonely and dark that you need this kind of validation?

I honestly don't understand why you bother.. don't you have something more interesting and productive to do?

Hello,

Note that Mr Paul Finch (Portfolio Club U.K) E-mail address has
changed from pfinch@mettav.demon.co.uk,
To: paulfinch@x-stream.co.uk
The telephone number stays at +44 (0) 181-286-8990 (answermachine)

Please pass this information on to one other person.

Also:

WHAT HAS HAPPENED TO THE TAVERN BBS?

Can anyone help me with the above, which is a London (England, U.K) based BBS.

I was logging onto them approx once a week when suddenly the number just
started to ring and ring but does not log on to the BBS. Yes, all my computer
equipment does work as that is how I got here!

I have even wrote to Mr Paul Baker (the Syops) but no reply!

HELP, does anyone know what has happened to 'The Tavern BBS'?

Paul

We MUST keep the Atari Portfolio Alive!

probably one of the most legendary games programmers of the last 20 years; you may have heard of him from games like Llamatron 2112 and Revenge Of The Mutant Camels, as well as light synths like Trip-A-Tron. I believe he got his start programming games for the Commodore 64, then moved on to do games for both Amiga and the ST, both commercial and shareware. (He did one Falcon game, LlamaZap, which is bloody incredible - you had to steer a spaceship on several levels, one of which had you fighting a 50-foot LlamaZord - did I mention he has this thing for putting ungulate animals in his games?).

He also was briefly employed by Atari during the Jaguar's heyday - he programmed Defender 2000 and Tempest 2000, as well as programming an incredible light organ program in the Jaguar CD-ROM unit. These days he's working on Project X with a number of other ex-Atari employees.

Last Easter I downloaded NoSTalgia, an Atari ST emulator for the Mac, onto my brother's Performa; included with it was a copy of Revenge Of The Mutant Camels (which is shareware). Although it ran a bit sluggishly, my brother and niece were taking turns giving it a go, they were quite entertained by it. Still is very addictive despite its age.

well, here's some interesting news about how Apple's "revolutionary" new iMac has REALLY been selling: hot out the gate, but now rapidly cooling now that the initial rush of fanboys buying this new Mac has dropped to a trickle - as I predicted. Do note too the numbers of product shipped vs. actually sold.

Also note: the expert quoted mentions that the iMac is priced too high and is underfeatured, as well as its relatively smaller software base.

Of course, TIFKAS (The Idiot Forever Known As Sinclap) will try to put some sort of positive spin on this by quoting some sort of Steve Jobs Reality-Distortion Field� -fueled press release (or try to throw some smokescreen like bragging what a "macho stud" he is, or making fun of my appearance). Sorry, clown, but the circus just left town.....

Although Apple (NASDAQ:AAPL) shipped 278,000 iMacs during the product's first six weeks, only about 76,000 of those actually landed in the hands of customers, according to ZD Market Intelligent analyst Aaron Goldberg.

Sales during September were about half those in August. And they slipped further in October, said Goldberg, who compiled the data by interviewing resellers.

ANALYSIS: IMAC MOMENTUM STALLS AFTER FAST START

Some Apple watchers said the numbers aren't surprising, especially considering the hype that drove true believers to the stores in droves the day the iMac went on sale. Many retailers sold out.

"The iMac is a product that trades on emotion," Dataquest analyst Scott Miller said. "It's like those people who ran out and bought the first Beetles. At some point you run through those buyers and you have to get that next generation of user."

To reach that generation, Apple has to stress the iMacs value and simplicity, he said.

PRICE TOO HIGH

But Goldberg warns that one of the major barriers to iMac is still its price tag, $1299, in a world where computers are dipping as low as $599. Also, many potential buyers are still wary of the iMac's lack of a floppy drive and the relatively small selection of Mac software.

WEDNSDAY, NOVEMBER 18, 1998 is the date for the Toronto Atari Federation FLEA MARKET! The doors open to the public at 7:00 PM and will remain open until 10:30 PM.

This is your chance to come to a bazaar of Atari related pre-owned hardware and software where you may find that peripheral, application or utility for your ST/Mega/TT/Falcon 16/32-bit computer system or your XL/XE 8-bit classic computer system.

If you have original software or hardware that you no longer have any use for, get yourself a half-table and try to sell it! Or find that treasure that you have always wanted. Great deals should be in abundance.

Half-Table's will be $5.00 or the Full-Table for $10.00 each. Half-Table's are FREE to TAF MEMBERS. Admission is $2.00 per non-member family but if you are selling and have taken a half-table or more, admission is inc- luded. Admission for TAF members is, of course, Free.

The Flea Market will run from 7:00 PM to 10:30PM, with setup commencing for sellors after 6:30 PM, and teardown after 10:30 PM. This should allow enough time for as many people inside and outside Toronto to attend the event.

As usual, piracy cannot and will not be condoned. You must be selling original pre-owned software only. If anyone is caught selling pirated software or stolen hardware, they will be dealt with severely!!

The TORONTO ATARI FEDERATION Flea Market will be held in the "Rose Room" of the North York Memorial Community Hall on the Lower or Concourse Level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkhome Ave. Parkhome is 5 stoplights North of Hwy 401 running East off of Yonge

The Project X posting was a legitimate debate post. I suggest you read the article...does have valid points.

The iMac has sold very well. There has been lul in computer sales(ie, wintel also) in traditional slow October. However, sales of all computers have been steady thus far in November from my visits into Wisconsin this week.

I saw the product shipped vs. actual sold number. That has been debunked. 40,000 units were sold, ie. went to folks homes in Japan alone. The same number all over Europe as well at least three times the number in North America according to Apple's public notes. Your full of beans as usual.

Plus Apple's G3 pro line has sharply increased to traditional pro markets according to published remarks in Computer Reseller Weekly.

Nice try..

> Also note: the expert quoted mentions that the iMac is priced too high and is underfeatured, as well as its relatively smaller software base.

The small software is a figment of your imagination.

> Of course, TIFKAS (The Idiot Forever Known As Sinclap) will try to put some sort of positive spin on this by quoting some sort of Steve Jobs Reality-Distortion Field� -fueled press release (or try to throw some smokescreen like bragging what a "macho stud" he is, or making fun of my appearance). I am a lady's man, what can I say....-) What about caliing me TIFKAS. It's like calling the Pot -Kettle black..

> Although Apple (NASDAQ:AAPL) shipped 278,000 iMacs during the product's first six weeks, only about 76,000 of those actually landed in the hands of customers, according to ZD Market Intelligent analyst Aaron Goldberg.

Thats been debunked..

> Sales during September were about half those in August. And they slipped further in October, said Goldberg, who compiled the data by interviewing resellers.

Sales of all consumer machines have slowed...

Another myth. The average consumer wintel machine is priced around the $1300
machine. Thats were the market is. The $599 PC whatever that is may not fly
in the market once folks know what it includes.

Heck Compaq has Presario PII's 400 still above $2000.

Peter S.

>Is this just another jihad speak?

nope - just what is being confirmed and said on comp.sys.atari.st by a user who's just bought a Milan:

Well guys, you persuaded me. Let me tell you the story of me and my Milan. It all started when the dsp from my Falcon gave up working. I had just planned to invest in a afterburner or ct2 and a graficscard. But I considered upgrading a half working Falcon not really worth the money. Then came the Milan in the picture. And for about the same cash I had to spend on my Falcon. So I decided to buy a Milan. Also because it (hopefully) offers more upgrade options in the future.

So, I odered a Milan the Milan-tower you all know from the pictures. But that was a mistake...Because so many people wanted that case it was sold out, and I had to wait 4 weeks before they got new ones. But finally I got it. (with thanks to my supplier ACN to bring it home to me personally the day the received it at their office)

So what did I get? A basic Milan in a big Milantower, 16Mb ram, more than 1 Gb Harddisk, a CD-rom with Naes and some mostly boring software. A modern high res. ps2 mouse, and a 80286 PC keyboard of the kind that says 'klick' when you push a button. Really anoying is that there is no key for the '\' and that you have to treat it as a atari keyboard (for example [shift] [2] gives " and not @, as the button shows)

The first acquaintance of the Milan wasn't really positive. To name just a few of the problems: At first my Atari ptc1426 VGA monitor didn't want to work with the graficscard and I had to buy a new monitor. Then the supplied CD-rom was not readable in my 2speed cdrom player. The centronics printer port was connected the wrong way round on the motherboard. And the only working communication port was not connected to a outside serial interface.

Starting up the Milan is a real joy: It goes very fast. Screen updates are very fast also. Realtime scrolling without flickering! Compared to my Nemisised Falcon is the disk access and printing also very fast.
Most programs that work on a TT or Falcon also work on the Milan or else it often helps to switch off the caches. Yet it is a pity that programs as Apex Media can't be used.
Mint and Naes are working great now. It took me some time to configure it right, but the system now almost never crashes. Still I hope there will be a MagiC for this system soon.

What I'm really missing are games, like Running. And a standard soundcard. And finally I hope it will be posible to use the fastserial port with the next TOS update, because I'm getting sick with the 19200 Baud I have now.

Ciao,
Karsten

Milan 040/16/1210 Mint1.15, Naes1.2

end quote.

well, now you know. Of course, you'll come back with a retort involving my weight or you'll try to smokescreen the issue. Doesn't matter, though, as you've proven yourself to be a complete moron on all things Atari. Jeff Minter was right - maybe you should rename yourself Mr. Hankey and get it over with. :)

>> Is it me, or do you get the idea that whenever TIFKAS posts here,
>> you get the mental image of him parading down main street in broad
>> daylight with his pants around his ankles? :) Like his recent pathetic
>> attempt to disrupt the newsgroup with his rantings about Project X and

>> the former Atarians working on it - guess TIFKAS still hasn't forgiven
>> Jeff Minter for calling him a w*nker, a tosspot and a t*rd.
>
>The Project X posting was a legitimate debate post. I suggest you read the
>article...does have valid points.

a) this is a COMPUTER debate area - not games machines. You of all people should know the difference.

b) you were elegantly debunked by those who replied to you.

as usual, the only "chunks" TIFKAS should be concerned with are the ones he blows all over the Atari forums....
>
>Here we go again...Will be in Omaha on Fri - Sun.

yep, the Missouri posse has joined up with the posse from Texas. Shouldn't be long now.....

>
>> well, here's some interesting news about how Apple's
>> "revolutionary" new iMac has REALLY been selling: hot out the gate, but
>> now rapidly cooling now that the initial rush of fanboys buying this

>> new Mac has dropped to a trickle - as I predicted. Do note too the
>> numbers of product shipped vs. actually sold.
>
>The iMac has sold very well. There has been lul in computer sales(ie, wintel
>also) in traditional slow October. However, sales of all computers have been
>steady thus far in November from my visits into Wisconsin this week.

turns out that it's a slow downturn in the entire industry, and
it's not just a "lull". Get your facts straight.

>
>I saw the product shipped vs. actual sold number. That has been debunked.
>40,000 units were sold, ie. went to folks homes in Japan alone. The same
>number all over Europe as well at least three times the number in North
>America according to Apple's public notes.

cite please. My source was with Ziff-Davis, a well-known and
balanced publisher of computer facts. Plus there has been no
"debunkings" reported in comp.sys.mac.advocacy (a place where you
almost never post, since you'd be rendered "extra-crispy" in seconds :).
I'm demanding cites from you, owing to your well-documented making up
of facts (like "90% of all TOS applications fall over on the Milan -
got a cite for THAT?).

>Your full of beans as usual.

yep, I like beans - pinto, lentil (President's Choice makes an
excellent lentil soup), red and black kidney (for my homemade chili,
which everyone seems to like), navy (a good vegetarian baked bean,
complete with tomatos, onions, and green pepper makes a great meal for
these chilly fall nights) green, yellow wax. Interested too in
trying out fava beans as well (but will skip the nice Chianti).

Being "full of beans" is better than what we all know what YOU'RE
full of - I prescribe some Ex-lax or Geritol, or bran muffins :)

>Plus Apple's G3 pro line has sharply increased to traditional pro markets
>according to published remarks in Computer Reseller Weekly.

printed cite please.

>
>Nice try..

try "bullseye". Or haven't you noticed the plume of smoke coming
from the area of your keister?

>
>>   Also note: the expert quoted mentions that the iMac is priced too
>> high and is underfeatured, as well as its relatively smaller software
>> base.
>
>The small software is a figment of your imagination.

nope. Been over to Computer City Canada on the weekend (yep, AKA InCompUSA) and noticed that while their Apple department, as well as the entire store, is now much-improved layout-wise, there was still a miniscule amount of software for Mac as compared to PC. Same situation at all the remaining Mac dealers in Toronto (the Elm Street branch just went under, BTW). The U of T's computer department had an absolute dearth of Mac titles.

You're the one which suffers from figmentation of the imagination - like claiming that there are "Atari Jihads" that are "out to get you", that Atari Internet software is "inadequate" when you've never even tried them for yourself, that you "successfully refuted my complaint" against you at CedarNet (I find that hard to believe, as David from CedarNet CONCEDED that you were abusing your ISP privileges), and claiming that I am a major nutcase with paranoid tendencies who believes in X-Files/Oliver Stone-like scenerios (wrong again, weinerhead - my favorite book right now is CASE CLOSED by Gerald Posner <who has a few interesting things to say about Oliver Stone and Jim Garrison in their fevered imaginings of grand conspiracies>, and my third favorite magazine is SKEPTIC. And I only watch the X-Files because (a it's a great fictional telling of some urban legends, and b) Gillian Anderson is a total babe :)

No, I take that back, to have imagination, one has to show signs of intelligence. :)

>
>> Of course, TIFKAS (The Idiot Forever Known As Sinclap) will try to

>> Jobs Reality-Distortion Field� -fueled press release (or try to throw some
>> smokescreen like bragging what a "macho stud" he is, or making fun of
>> my appearance). Sorry, clown, but the circus just left town.....
>
>I am a lady's man, what can I say....-)

like all your ramblings, I find that hard to believe. The only women who could cope with your noxious twerpiness are either negotiable or inflatable.

What about caliing me TIFKAS. It's
>like calling the Pot -Kettle black..

I call you TIFKAS (The Idiot Forever Known As Sinclap) because

a) you're an idiot (a well-proven fact - in fact, one can prove oneself of how you always get it wrong by using DejaNews. Or simply by counting all the spelling mistakes in your posts)

b) you'll always be known as Sinclap, no matter if you try using your real name to post.

Now is that too hard to comprehend? Que pasa, little man?

Now maybe if I was really nasty, I'd be calling you things like

a) the 'Clap
b) Peter, the Hapless Dog-Faced Boy
c) Pig Vomit (oops, Howard Stern probably has that one copyrighted
:))

be thankful I only refer to you as TIFKAS.

>
>> Although Apple (NASDAQ:AAPL) shipped 278,000 iMacs during the product's

now that TIFKAS (The Idiot Forever Known As Sinclap) has crawled out from under his rock, here's another posting from comp.sys.mac.advocacy for him to chew on.....

From: winguy@my-dejanews.com
Newsgroups: comp.sys.mac.advocacy
Subject: CNN: PentiumII crushes iMac with ease
Date: Tue, 10 Nov 1998 00:56:11 GMT
Organization: Deja News - The Leader in Internet Discussion

Think CNN believes Steve Jobs and his lies about the iMac and the PentiumII? You guessed it. Think Different.

From http://www.cnn.com/TECH/computing/9811/09/macvp2.idg/

'(IDG) -- Sure, the iMac is a cool-looking computer. And the translucent aquamarine box is helping Apple regain profitability. But interim CEO Steve Jobs' boast that the iMac is faster than the quickest Pentium II is pure hype -- and it falls apart under scrutiny.'

'To see whether Apple would make believers out of us, we pitted the iMac against two Intel-based PCs: a pricier Pentium II-400 system and a Celeron-based machine that costs about $300 less than the iMac. The results: In its base $1299 configuration, the iMac finished last in each of our application tests. The system was nearly as easy to use as the company claims, but its poor performance means Apple failed in its core mission.'

'With 32MB of RAM (its standard shipping configuration), the iMac got clobbered on our Excel and 5MB-image Photoshop tests; in fact, the slower of our two test PCs, a Packard Bell Multimedia 945 with an Intel Celeron-333 processor, finished ahead of the iMac by 55 percent and 80 percent, respectively, on these tests. And when we compared the iMac to our high-end system, a $1799 Micro Express MicroFlex-c400A with a Pentium II-400 CPU, the contest was, well, no contest. The iMac took more than three times as long to finish a standard series of Excel operations, even after we doubled its RAM.'

I like the part about the iMac finishing last in every test. But then again, thats nothing new. We have seen that in just about every other test done. They also speak about the so called 'ease of use' and the lack of a floppy drive (cha-chin$), but I'll let you go and read that part for yourself. God, how many times now have professionals in the industry proved without a doubt Jobs' lies wrong? Must be at least a dozen. Has any gotten through his reality distortion field? Doubtful. Maybe if we are lucky Apple will get sued for false advertising. Ahh well, at least most everyone here after reading so many articles by the industry professionals knows that the iMac cant even dust a cheap PC not to mention the fastest pentiumII. Those not still caught firmly in the RDF, that is.

Regards,

WinGuy

Actually, it's more of a protocol issue. What is the standard way of identifying devices after start-up? Answer: none because SCSI wasn't designed with that in mind.

Huh?
1) _WHY_ is USB "better" (and for which purpose specifically?)
2) It would probably suffice to use newer drivers?
>I don't know what you are talking about. I'm claiming that PC parallel
devices
>are not PnP and USB devices are. Do you believe this to be true or false?

False. Some parallel devices _CAN_ be PnP (OS, device and everything
inbetween-dependant).
USB doesn't necessarily need to be plug&play. The OS does not need to make
use of it. It could resort to existing ways of comms over a daisy-chained
setup.

>> Broadcast stations lowering effective thruput drastically
>> by unnecessarily throwing messages on the bus would be

Ever heard of "Ethernet"? Compared to say - Token Ring - there is an abundance of redundant signals and packets resends, which reduces the effective usable bandwidth. Then there's the system of using hubs which is being replaced by switches for a reason (e.g. allocatable bandwidth, which is IMO nothing more than a patch to reclaim some bandwidth by allocating more to nodes that actually make use of it). USB also uses hubs (which AFAIK equally devide the existing bandwidth), which has advantages over daisy-chaining as well as disadvantages.

All this IMHO and AFAIK ofcourse :-)

>
>By "user", do you mean "application" ie. user in the mainframe sense? I can

You can on Ataris... (well technically). And how old is this established controller port standard? Reaches waaaaaaayyyy back.

By determining which device is suddenly signalling. Think of the automagic
mouse/joystick switches (Roboswitch?) for Ataris 'n Amigas (and other
systems conforming to the Atai controller pinout standard).
But then, it's nothing new really.

> At least with a standard joystick port, all software
> can make decisions based on specific assigned input

> out.

Exactly. It also probably offers better response and less intermediary
dependency upon eachother. So, when your USB printer breaks down or produces
errors (imagine you have one of those devices that you cannot turn off...)
i'd hate to think that it might sever my modem connection, corrupt or deny
any and all input on other devices and ruin my active ISDN TA because
therefore the Flash update fails.
Phew.

It is. 64-bit in 1993 :-) Nintendo came in 1996 (in Europe).
VLM :-)

>(when you consider the time in which they were released). It's a pity the
>world wasn't ready for consoles at that time...

The world was ready for Nintendo and Sega. And later on, for CD-I but not
until Philips / Magnavox switched titles from education to full motion video
(CD-video), sex, computer games....

>For instance... Most games that became available for the CD32 were simply
>slightly modified versions of Amiga games available at that time, and most
>of them didn't take advantage of the extra capabilities of the CD32.
>Developers weren't interested it seems, unlike today...
CDTV and CD32 were true Amigas. Just like some Falcon was originally planned to be (or so I've read).
Reminds me of really old consoles that had computer add-ons for them.

But all-in all, did CD-I make it? Did 3DO make it? IMHO, the CD32 and moreso the CDTV deserved more attention and support than the former two ever did. I'd prefer those anytime (except that it'd be nice to have something for every platform, so if I'd buy an Amiga, it'd be a complete one, if you know what I mean).

I know someone who gets to do all existing applications on the Net except perhaps Java, on his 8-bit Atari 800 XL. There's also an abundancy of cheap ST's and Amigas (which do not require a dedicated VGA/XGA VDU - an existing TV will do nicely), and even a PC/XT with a cheap modem will get you on the net. (Use Arachne).

You do not need Pentium stuff for simple browsing and E-mail. I'll bet I can get you on the net with ANY real PC for less than 1/2 the cost of a WebTV, using completely free stuff. Even adapters to get your VGA pic on a TV cost me less than $55 US.

:-)

O.k. perhaps I've been a bit harsh and I didn't mean it quite as hostile as
it sounded (reading this entire thread trhough to the end as well as having
read the entire "Errors in my recent megapost"-thread), and maybe I even got
carried away defending myself and my post with such intensity. But really, I
can be a nice guy, and hey - at least I stirred up some discussion.

I love alternative platforms. Now let's go kick Wintel-Wintendo's behinds
:-))

Actually, you would have channels or whatever packet
switching method that USB is using. Infact, I wouldn't
be surprised if the current port has enough free wires
to carry all the USB signals such that a newer joystick
could be either & not push the buyer in one direction
or the other artificially.

For the vast majority of users, this isn't a problem
Furthermore, it's a good idea to have a dedicated interface
for some of those 'slow speed devices'. Although a keyboard/
hub could be a useful contraption.

That doesn't do one much good now. It doesn't do anything
to minimize the fact that your 3rd USB device will cost
you an extra 100bux.

The problem with this retort is that USB is not required to
solve this problem. Just add station and device ID's to the
current extended joystick protocols.

The port is bidirectional, actually, so the printer should be
more than capable of reliably identifying itself.

Perhaps you could point to another x86 OS that does it right.
The relative complexity of PC hardware is as much an issue as
anything else in this sort of setup.

```
     That still doesn't tell the OS what it should do with the
     input. The OS will have to make some potentially dangerous
     and likely wrong assumptions for your schema to work.

>
>>   At least with a standard joystick port, all software

     That still leaves how to interpret the input. Is is the left
     tank stick or the right? Is it for user 0 or user 7? The only
     way your scheme would work reliably is if you restricted it to
     those situations where an automated driver on a standard joystick
     port would work as well.

Because I don't see any Atari computers let alone Amiga which are
internet capable around here and probably wouldn't have the money for
one anyways. Therefore I use the $100 webtv. Sorry I didn't have time
to construct an argument last time. I don't know that much about Amiga,
but what I do know makes it seem as though it sucks when compared to
Atari. That is why I made that statement.

<10115-360E949A-10@newsd-214.iap.bryant.webtv.net>...
FYI, Mr. Amiga, Myst has been available for Atari since the Jaguar CD
VGS. Amiga sucks. WebTV sucks, but I use it. If it were based on an
Atari platform, it would have greater potential.
I have worked with computers of all sorts for quite a few years now and
have yet to lay my eyes on a Jaguar, and therefore Myst on an Atari. You
do know the difference between a console and a proper home computer
don't you?.
And if WebTV suck so much (and it does) WTF do you use it?. Why not use
an Atari?
WebTV has zero potential, no matter what platform it is based on.
A well constructed arguement on why the Amiga sucks would have given you
some credibility with your opinion, but as it stands it sounds like
something an illinformed 14 year old would say.
Clockmeister.

Do you mean pin layout or signaling interface? I believe that there are only
three of the later standards: SCSI-1 (also called CCS), SCSI-2 and SCSI-3.

> I would be surprised if you could even enumerate them all.

So would I. But I wonder why it is relevant.

You can't update the firmware in your joystick so any new drivers would have to use the old communication protocols anyways. So you would have to replace your devices. If you are going to replace your devices then you may as well use the better (see above) USB interface.

> False. Some parallel devices _CAN_ be PnP (OS, device and everything

But that's the problem. Sure, we can devise a totally solid PnP system on top of a parallel interface. No problem. But, unless our parallel devices have updatable firmware, we need new devices. If you are going to replace your devices then you may as well use the better (see above) USB interface.

Of course :-> But this is not really a weakness unless the effective bandwidth of USB drops below what you need. If you are using USB to replace parallel, serial or game ports then it won't be a problem.

> You can on Ataris... (well technically). And how old is this established
> controller port standard? Reaches waaaaaaayyyy back.

I believe that is because all the joysticks send the same signals. That kind of sucks if you want to give your joystick some interesting behavior that requires new signals.

Why is it a good idea? Why have ports that you don't need and others that you need more of when you can just standardize on one interface?

> That doesn't do one much good now. It doesn't do anything
> to minimize the fact that your 3rd USB device will cost

Good point. But I think that by the time most people get their third USB device, the price will have fallen.

> The problem with this retort is that USB is not required to
> solve this problem. Just add station and device ID's to the
> current extended joystick protocols.

But how do I do that without throwing my existing joysticks away? And, if I am going to do that, why not just use USB instead?

> The port is bidirectional, actually, so the printer should be
> more than capable of reliably identifying itself.

I'm talking about existing devices. Not what a device could do with an interface standard. You can't change the way most existing peripherals behave.

> You are misrepresenting EPP.

How so?

> Perhaps you could point to another x86 OS that does it right.
> The relative complexity of PC hardware is as much an issue as
> anything else in this sort of setup.

The fiber channel must be flawed because no x86 OS handles it correctly.

> You didn't mention USB in your demand actually.
> If you can demonstrate why ethernet is a bad
> comparison we're all ears.

I said "Please provide a specific example, that you know can happen on USB, which "drastically" reduces through-put." And the need to demonstrate is not in my court. You made a claim, you need to defend it. I do not have to prove a negative.

> That's what the driver for, just like an 8 port or
> more serial card.

So the driver knows about every possible device so it can tell which one it is talking to?

> That still doesn't tell the OS what it should do with the
> input. The OS will have to make some potentially dangerous
> and likely wrong assumptions for your schema to work.

I understand now and I don't share your concern. The Mac has worked this way for years and I don't recall it having been a problem. If you press the 'G' key, it doesn't matter what keyboard you pressed. If you are playing a game then may have to configure each joystick separately if they don't share common button configurations. But, unlike the game port, once you configure a joystick, you don't have to tell the operating system which one you want to use. It will figure out that you want to use it when you actually do use it.

> That still leaves how to interpret the input. Is is the left
> tank stick or the right? Is it for user 0 or user 7? The only
> way your scheme would work reliably is if you restricted it to
> those situations where an automated driver on a standard joystick
> port would work as well.

See the above. Remember that this situation has existed for years with ADB. Has anyone told you that they found this to be a problem?

Faster compared to what?
Existing interfaces on PC's have ALL been standardized
Small I agree upon (as stated earlier)
Parallel ports can be hot-pluggable (try external CD-RW with UDF standard)
>interface is small, etc. Really, except for the (short-term) high cost of
>hubs, what is bad about it?

It's yet another new standard and yet another incentive to buy more, newer
hardware. Yes it has some improvements, but about as much as AGP has over
PCI. Ofcourse one is better than te other, but is the relative cost of this
really justifiable? HOW MUCH better is it?

My CD-RW (parallel) _has_ updatable firmware. So do some laserjets (but why
do that if you can simply take the roms out and put new ones in it?)

It WILL be if you start using ADSL modems or bandwith aggregation with
Wincrash 95/98

Which is not impossible. You could make hardware adaptors that provide these
new signals. Have you heard of some arcade joysticks on Atari? Amiga, MSX,
7800, and other Ataris all have the same joystick standards yet some provide
different features on joysticks than others. MSX and 7800 provide multiple
firebuttons without special hardware on the joysticks or ports to seperately
utilize, the ST's only use one because the other can be used as an extra
mouse button and on the Amiga you can connect analog joysticks to the same
ports.

This is the same answer as "why use AGP" would give: "because it can use
your PC's memory as well as dedicated memory which allows for more complex
graphics" (without stating that this sometimes may severely impact the rest
of your PC's performance. And multiplexed multitasking hasn't been really
one of the PC's true strengths anyway...)

     You only need new devices if you want the new features.

     If you don't want the new features you don't have to
     worry about your options drying up. ST/TT users should really
     be pissed about this sort of thing as these ancient standard
     ports have constituted what support has been left for the
     line.

Ever seen the number of unused wires on a serial or parallel
interface or an svga one for that matter. That's likely why
the interface is now a PnP one with no ill effects done to
legacy hardware.

If you like the simplicity of STs, you'll love Macs, since the STs
were, and still are (more than ever) a poor man's Mac!

People hate the Intel/Microsoft duo simply because they became what
they are today not because of their inherent qualities, but through dirty
business tactics. Ask yourself why Microsoft is sued every month, and
Intel too, but on a less frequent basis.

Get a Mac, you'll see it's still "fun" to use a computer.

True. It was easier to add memory too. And accelerate the CPU. And
add a HD. And... you get the point :)

Old, used Macs cost peanuts, and can be setup for the Net easily.
Much more user-friendly than Arachne running on an old PC.

Yes, it had to be easier, not to plug and use, but to FIND peripherals. Ever tried to find a wireless ADB keyboard? One was released a couple of months ago. None was available before that. Now, with USB, things are different. There were USB keyboards out there even before the iMac, and many more will come after its launch. Same for mice, joystick, etc. I believe that you, as an ATARI user, can relate to this. It's kinda hard to find peripherals once you use proprietary technology. Apple, by adopting USB, made it easier for its users to find stuff for their Macs, without compromising quality and actual ease of use, because, AFAIK, USB is just as good, if not better, than ADB.

USB is slower than what? What are the other available options? The standard serial/parallel ports of today (no, of the past, these are real old technology) have maxed out its capacity long ago. USB came to replace those. If you're thinking about using USB for HDs and things like that, it'll be slow, because USB wasn't meant for that. Use Firewire instead.

>
> Actually, USB looks remarkably like the past, a past that
> many of us were glad to see gone.

You're delusional. I understand ATARI users like to stick their head firmly in the past, but this is beyond comprehension. Man, my stupid ATARI needs a hack to make its serial port go beyond 19200. Is that good technology? I don't think so.

USB is the future, a future I'm glad to see Apple is moving towards to.

      USB is hot-swapable indeed.
      I know USB is better than ADB at PnP. That's why I actually _LIKE_
USB :) I don't know what impression you got of my previous post.

So I take it you like having different connectors for each thing? A mouse port, a joystick port, etc. Wouldn't it be easier to have an universal connector, so _ALL_ computers (PCs, Macs, even ATARIs) could use the same devices?

> The question remains: just what was broken & why the pressing
> need to replace interfaces and devices that work perfectly well
> as is.

It is broken indeed. Serial ports have limits now, same as parallel ports. They're kludgy. It's time to move forward, to unify the ports. USB came to do that, and I hope it succeds!

The past I think he is referring to is the old 8-Bit Atari's, and how they
daisy-chained by serial connection, -which- does remind one of USB quite a
bit. (in fact, IIRC, it even offers a few advantages) ;-)

Capiche? ;-)

What "catch1" said was that all big-box Amiga's came with CD quality sound.
I stand by my original reply. He was wrong. The Falcon however, does have
CD quality sound from the box, day 1, whatever...no expensive add-ons are
required. ;-)

Clarify the 14-Bit spec for me-to achieve that, Amiga's have to split
the original channels/lower the frequency? Is that right? Also, does
it require more processor time/faster CPU than a standard 68k Amiga?
(or the A1200?) Thanks in advance for the info.

Goodie: now you can make your iMac look just like
an Atari 800 with it's interface port hub.

Sorry, but Expensive Octopi just don't impress me.

USB doesn't adequately address those limits and
imposes some of it's own. Furthermore, those
limits are being actively misrepresented.

     Decentralized IO for PC's has some interesting potential.
     However, the directions I see USB going in don't seem to

indicate that USB will achieve any of that. Furthemore,
this crop of USB advocates seem to view it as an excuse
to make life as difficult as possible for users who
see little promise in USB and/or are perfectly content with
their older interfaces.

I was reading some of my early posts in here and really surpised myself. I must have been in an excessively bad mood. I don't normall call people names, let alone the ones I was using.

Fist off, I'll straighten out that reply to the iStapler post. I thought that the site was very funny and showed how stupid Apple's new design was (IMHO). And at the time, I thought that Sinclair was actually a decent Atari user like the rest of us (well, most of us, anyway).

As for my involvement in the Atari vs. Amiga war, I personally love Ataris very much and saw some of the postings by Amiga supporters very insulting, and therefore responded in an equally insulting manner. However, I grew up with a Commodore - it was the first computer I ever had/used. The Atari 2600 was my first game system, which I had first. Now recently, I have begun collecting Atari stuff and have about 150 2600 carts. I also purchased a new C64 and an Atari 800XL. I happen to think that the Atari unit is a nicer system. Now if anyone can tell me how to get internet access on my Commodore 64 or 128, I would be VERY

GRATEFUL. What about the Atari XEGS? I've heard there was a modem for it as well.

Everything I say on here is IMO, I do not pretend to base all of my statements on solid facts, because there is a lot about both Amiga and Atari that I do not know, although I do know more about Atari.

So, let the newsgroup go on! Sorry for all of my babbling.

-Casey

I just wanted to bring up this point. I purchased an Epson Stylus Pro early last year and as soon as I plugged it into the back of the computer (power was already on), Windows 95 recognized it's presence and asked for a driver disk for the device "Epson Stylus Pro". Now how could it have done this if parellel ports are not PnP?

Group: comp.sys.atari.advocacy Date: Tue, Sep 29, 1998, 9:47pm (EDT+4)
From: quinlan@intergate.bc.ca Re: JAVA for CAB?
In article <slrn7122rq.93i.jedi@dementia.mishnet>, jedi@dementia.mishnet () wrote:
Yes, it will. The USB devices can be uniquely identified and their signals forwarded to the appropriate driver. The game port does not have enough information to do this. Also, I am not advocating that everyone replace their
=A0=A0=A0=A0=A0=A0=A0=A0=A0 =A0 =A0 Considering what can be done with current joysticks, that's =A0 =A0 =A0 dubious assertion.
Actually, it's a true assertion that can be easily tested. Buy a game port expander and plug a Flightstick and a Gravis Game Pad into it. Without using the "Game Controllers" control panel (or doing it directly in the game if it does direct controller management), neither device will work. And when you switch devices, you much change your settings.

With USB, you don't have to do this because the operating system knows what device is sending the signal.
Actually, I develop SV software for NT. I run Windows 98 at home. Say I attach a new printer to my parallel port. Will the drivers for that device be automatically loaded? No, the won't. So why do you think that parallel
devices are PnP?
=A0=A0=A0=A0=A0=A0=A0=A0=A0 =A0 =A0 All the device needs to do is to be able to communicate with =A0 =A0 =A0 the OS. Even something as old as an HP540C can do that with even =A0 =A0 =A0 the first release of Win95 quite nicely. It merely the same =A0 =A0 =A0 level of organization and discipline required for IP port and =A0 =A0 =A0 PCI ID assignments.
Doesn't the phrase "Plug and Play" imply that you can use the device as soon as it is plugged in? This is not true of parallel devices because you still have to manually load the drivers. With USB, the drivers are automatically loaded.
=A0=A0=A0=A0=A0=A0=A0=A0=A0 =A0 =A0 Win98 should have been gold at that point. It was very =A0 =A0 =A0 likely a release version. Furthermore, it was a staged =A0 =A0 =A0 PR event. So one should expect the conditions of the test =A0 =A0 =A0 to be rather ideal. This was not some early QA iteration.
But even if the release version of Windows 98 has this bug, it wouldn't make USB a flawed interface standard. Just as flawed SCSI handling in Windows 98 wouldn't make SCSI a flawed interface standard.
=A0=A0=A0=A0=A0=A0=A0=A0=A0 =A0 =A0 Both are an issue. The concept is as much of an issue as =A0 =A0 =A0 the implementation is. Abstract design concepts very much =A0 =A0 =A0 impact real world performance.
Can you describe some specific aspect of the design that might make for flawed real world performance?
=A0=A0=A0=A0=A0=A0=A0=A0=A0 =A0 =A0 ...sounds more like your problem is in windows, actually. =A0 =A0 =A0 Either way, it seems that you will still have to manually =A0 =A0 =A0 tell the OS something.
OK, explain to me how, in any operating system, you could tell what device is sending you signals over the game port? You could not tell unless these signals happened to be unique for each device (which would be a huge fluke) and you had some huge amount of code that could analyse these signals and figure out which device was sending them. USB, OTOH, provices globally unique device identification (like Ethernet cards do) so the operating system can tell what device is sending what signal. It can then forward that information to the appropriate driver for processing. So, you do not have to "manually tell the OS something" with USB.

I can't believe I"m bothering to comment on this post (below). I've already apologized for my actions as I was in a terrbibly bad mood at the time, so if you cannot accept that and continue to act in a demeaning way towards me, then that is your choice, but be prepared to promptly be ignored by me.

Anyway, as for the Myst on Jaguar comment I made, I was only pointing out your error in the statement you made that Myst was never released on any Atari platform. I am quite aware of the difference between a computer system and a game system, but they are both types of Atari platforms.

I am also quite aware of WebTVs limitations. However I do not suck simply because I cannot afford anything better at the present time. I may not be as old as you, then again I may be older. However I have AT LEAST as much experience as you do with computers, albeit on other platforms, as after the C64 era, I moved on to DOS and then Windows and have done most of my work on those. I personally like the Intel architecture, and also Windows 98. I have never had any unforseen problems with 95/98, so I must be blessed by Bill Gates, hehe... I have been programming BASIC and Pascal since DOS 3, ran a BBS for several years before Windows came along and the Internet took away all of my callers in a remarkably short time. So now, I am back into Atari/Commodore systems, and if you can tell me how to get the internet running on one of them, I will gladly introduce my WebTV to the Classifieds or perhaps eBay. Until then, it suits my Internet needs.

FYI, Mr. Amiga, Myst has been available for Atari since the Jaguar CD VGS. Amiga sucks. WebTV sucks, but I use it. If it were based on an

Atari platform, it would have greater potential.
When we discuss Atari in an Amiga-Atari argument, we naturally mean the ST/TT/Falcon line of micros. The Jaguar was a console released by Atari, but has little bearing on an Amiga/Atari argument, and anyone with even the slightest knowledge of the age-old rivalry between the two brands would know that.
Your ill-constructed arguments won't help you either. "Amiga sucks." is hardly a decent argument and will convince no-one.
WebTV sucks, and so does its users.

Atari has done more for the home computer market and the advancement of its technology and marketplace than few other companies. It is right up there with Commodore and Apple.

They were both interesting developments, the first of their kind, but failed
in the marketplace, so that depends on what you think is important.

No comment, except to say that I personally don't like the new iMac design
either...
Reminds me of the old TRS-80 and Commodore PET 'all in one' designs.

> As for my involvement in the Atari vs. Amiga war, I personally love

Fair enough. I've never used an Atari 800XL so I'll take your word for it.

(It was kinda ugly though :-))

  Now if anyone can tell me
> how to get internet access on my Commodore 64 or 128, I would be VERY
> GRATEFUL.

If you can set up a shell account with your ISP then access is a breeze.
I'm no expert, so perhaps a visit to the CBM and C64 newsgroups could
enlighten you further.

What about the Atari XEGS? I've heard there was a modem for
> it as well.

I wouldn't know...

> Everything I say on here is IMO, I do not pretend to base all of my

```

I've been reading this thread, and all of you forgot something: daisy chaining. You don't need a hub, unless you have a truckload of stuff. Most devices will have passthru conectors (of course, mice and joystick won't!). But still, I'd rather have everything flowing thru 2 USB connectors on my machine than thru several cables sticking out of several different connectors.

```

No, you do. When USB printers are widely available in _BRAZIL_ (where I live), it probably means it's REALLY all over the place, and mind you, just saw an ad for those new EPSON USB printers on the paper today.

No, not true. PC joysticks won't work on your ST, and vice-versa. Same for mice. Isn't it a pain having to track down ST mice, just because it's some stupid proprietary format? How about the stupid monitor connector too? I wish people knew what "standard" means back in the 80s.

What? You mean USB is not adequate for serial connections, like, modems? How so?

Tell me some of those limits then... I can't seem to remember any...

All Atari intellectual property is owned by Hasbro Interactive. This includes copyrights, patents and software. The problem is they probably don't even know what TOS is, let alone that they own the thing. All they wanted was Asteroids.

Cheers,
Nick

Something that forces you to change all your hardware just because your
next PC will not be able have the right interfaces can hardly be
described as cheap.

This is what annoys me the most with PCs. Everything is supposed to be
standard, so that everything is simple and cheap. The problem is that
every 2 or 3 years they change the standards so that all your previous
stuff becomes obsolete. This goes for memory, but also for sound cards,
graphic cards, hard drives, mice, keyboards, etc...

When you buy a new PC now, you have to trash the keyboard/mouse (no more
DIN connector), your sound card (sorry, ISA is obsolete), extra memory
(what? you still using EDO ?), PSU (yeah, we're designing a new
stadard), printer (USB is great isn't it), modem (why add the cost of a
serial port, guys ?)...

Please don't say it's cheaper.

Actually, you could hardly call the serial mouse an intelligent
standard. It has become a standard because of PCs, but is pretty stupid
to a serial connection to run something as trivial as a mouse IMO. In
the 80s, there was no standard, so you had to develop a proprietary
interface to meet your needs. The ST monitor connection was also pretty
intelligent, as it automatically detected what type of monitor was on
the other end and booted up accordingly. The Falcon did the same.

A serial connection is definitely stupid for a mouse! You have to use
complicated electronics to convert the X-Y pulses into 8 bit serial data
that is then transferred over to the computer, who's driver is always
listening to the port, using up precious CPU cycles to decode the
incoming 8 bit serial data into X-Y pulses. That is a stupid standard if
you ask me.

Cheers,
Nick

Dan Cox wrote:

>

> Why does everyone hate intel and microsoft?

IMHO people do not hate them as I or MS, but the way we are forced to believe that these are the only options we have. People need to have alternatives from which to choose, so if someone tells me to use Windoze because I have to, I don't like this.

When the computer press talks about "computers" they usually mean Wintel. Any other alternatives are considered herecy. We are pushed to think that any other systems are useless, and this has led to a situation where this starts to be true. If you want a job with "computers" the basic requirements are knowledge of Intel compatible PC:s and MS software. No matter how good you are producing material with your A-group computers, if you are not familiar with Wintel, you are useless. The results are not what counts, but the means to do it. At home you can use what you like, but at work you are doomed... So I believe this is the reason for slamming the Big Ones.

> Intel makes good equipment

Good, not excellent.

> and windows makes decent software.

Windows makes your head ache :)

MS makes decent software, not excellent. The thing that bothers me is that MS employs hundreds(?) of people to write their programs, but they are still buggy and delayed by months, not to talk about the size they take. On the Atari side, look at Calamus, Papyrus etc. A handful of people have produced these in a very short time, they have all the features you need and still take only a Meg or two from your HD. How come? When you run a monopoly, nobody claims. Or if they do, so what. "You have to use our products. There are no other. Repeat after me a thousand times: There are no other." Look at Apple's 1984 commercial. Is it too late for something similar?

> Do people hate them because windows sucks? Or because they're just jealous of their
> success?

These are also some of the reasons, I guess.

> This has always baffled me. Personally I don't like windows much.

Seems to me your not qualified enough to make a statement like that, once
again, you provided no reasoning behind your statement.

If you don't know, don't judge...

Yes, it does require a better processor AFAIK to achieve 14 bit sound
reproduction. It is possible on 68000 machines but the results are not
good.
On faster Amigas the sound quality is reported to be almost
indistinguishable from PC 16 bit sound quality, so at a guess the frequency
response must remain fairly consistent with 8 bit sound. MP3 can be played
back this way also (with a fast enough CPU).

I'm no expert in this field, so I'd suggest you try C.S.amiga.hardware, they will be able to give you full details, and correct any mistakes I may have made.

Sorry I can't be more specific :-(

Regards,

Clockmeister.

I read a post in one of these threads that mentioned a hack that will allow this. I would like to be able to use a faster modem, so any help on this matter would be greatly appreciated.

-Casey

Nicholas Bales <bales@mygale.REMOVETHIS.org> wrote:

> Something that forces you to change all your hardware just because your next PC will not be able have the right interfaces can hardly be described as cheap.

You are speculating. I can't think of any PC, being sold right now, that has a USB port but not parallel and serial ports. Do you remember the transition from 5.25 to 3.5 floppies? First PCs came only with the former, then both and then, years later, only with the later.

> This is what annoys me the most with PCs. Everything is supposed to be standard, so that everything is simple and cheap. The problem is that every 2 or 3 years they change the standards so that all your previous stuff becomes obsolete. This goes for memory, but also for sound cards, graphic cards, hard drives, mice, keyboards, etc...

> When you buy a new PC now, you have to trash the keyboard/mouse (no more DIN connector), your sound card (sorry, ISA is obsolete), extra memory (what? you still using EDO ?), PSU (yeah, we're designing a new stadard), printer (USB is great isn't it), modem (why add the cost of a serial port, guys ?)...

Even two year old memory could cripple you new system's performance. You can still use ISA sound cards if you want. The are much less capable than PCI cards (which cost under $100) but there is nothing stoping you from using them. You can still use PCI graphics cards if you want. Using anything worse than that would cripple the performance of your new system. I have never seen a destop PC that didn't have both a serial and a parallel port.

> Please don't say it's cheaper.

Look, has anyone actually taken away the serial, parallel and game connectors
and their computers? If not then what is the problem?

Whats that suppose to mean? I don't have problems with the bloatness of IE4
and Communicator. Sounds like you are defending your browser of choice..

ROFLMAO!

You were actually funny this time. However, I don't think I could afford such high priced women. Anyway, I like the nose quite a bit shorter. I hate getting poked.

Besides, the comment wasn't suppose to be taken literally. It was suppose to be a degrading comment (directed towards you). Get with the program, or get out if you can't hang.

MG

I don't think so, Amiga boy. In fact, TOS is one of the reasons why the Atari succeeded. Not having a bloated operating system that did one thing at a time turned out to be great for a rock-solid MIDI platform with great timing - why do you think Ataris are still being seeked out by first-timers and pros alike? I still get fielded calls from people on where to find hardware.

And if you don't like TOS, there are some great alternatives - Geneva/Neodesk, MagiC 5 (which is a great operating system, accelerator and premeptive multitasking enviroment) and Linux....

where can you buy a real, brand new Commodore Amiga? You can still buy brand new Falcon clones (the C-LAB variety) from Titan in the UK.
>
>Atari is dead, but the Amiga has survived... and you can still buy new
>machines.

Commodore is just as dead. Or have the Three Stooges (Mehta, Gould and Haig) up and started the company again under the nose of the computer press? :) As for the new machines, well, all I've seen at www.amiga.com is excuses for why the new systems are not out....

as for used value, I was at Value Village last week. An Amiga 500 (complete with plug-in hard drive and modem) was going for around $12. A 520ST, complete with drives and mono monitor was going for $24.95. Guess we know who is considered more valuable.....

>In fact demand for new A4000T's outweighs supply, and there is a waiting
>list.

>FYI, there have been, and are Amiga clones - Draco being one, and a new
>English made one who's name escapes me.

no place to buy them here, as the Amiga dealers here are struggling
to survive....

There is also a WebTV type thing
>marketed in asia which is based on Amiga technology. (officially licensed)

judging by the lukewarm reaction to WebTV here in North America
(kin ya say "unmitigated disaster", boys and girls), I doubt we'll be
seeing and hearing this device here any time soon. Kin ya say CD-TV....

>
>How many companies are there still developing hardware/software for the
>Amiga platform compared to the Atari?

I would think roughly the same. I'm sure if you did a simple web
search you'd find LOTS of pro software and hardware being developed -
SoftJee, MGI, Titan, Black Scorpion, ASH, Electronic Cow, Floppyshop,
Gribnif, Systems Solutions, The Upgrade Shop among others....

Not to mention the labour of love being performed by the shareware
and PD authors (Thing being a good example, an excellent replacement
desktop - so good I've registered, it's THAT good....).

Peter, who on here really gives a flying iota about a stapler that is the same color as the iMac, outside of you? You gotta be a real maroon in order to think this subject matter relates to this newsgroup at all.

It is also a sad indication of your interest that you would get excitied over a stapler that has the same color as a computer.

- Richard Hutnik

huh?
The first A1000 could multitask in only 256Kb of RAM, hardly bloated.
That's pre-emptive multiplexed multitasking, hardly one thing at a time. In
fact Amiga OS was the first to bring this to a home computer and the Mac
still doesn't have this ability. Plenty of music software available on the
Amiga also, and the Amiga soundchip had better sound quality then the Atari

ST range.

The reason that the Falcon failed so miserably was BECAUSE of TOS.

Better check the facts Atari boy...

 I still get fielded calls from people

Gateway own the Amiga, and have done for quite some time.
Developer machine in November (or thereabouts) 1998, and the new Amiga II
available around late 1999.

I sell A2000's regularly for $100, but I can go pick up an ST at a local
goodwill for $5.
Amiga 500 harddrives are worth BIG $$$ around here, $100 easy for the HDD

alone.

There are NO Atari dealers anywhere in Australia, but I know of three
dealers here in Perth. Ofcourse not Amiga only dealers, but dealers none
the less.
Brand new AI A1200's are in stock, sold internet ready... No A4000's
because of the shortage.

The CD-TV was introduced ahead of it's time. Kin ya say DVD???

WebTV sucks, but they chose Amiga technology and OS for it's flexability
and stability, something TOS lacks.

Where are those 060/PPC dual processor boards for Atari?
How about 3D accelerated graphics cards?
Maybe the Quad processor motherboards?
OS upgrades?

>   Not to mention the labour of love being performed by the shareware
> and PD authors (Thing being a good example, an excellent replacement
> desktop - so good I've registered, it's THAT good....).
> >
MagicWB is a good workbench desktop enhancer, and Dopus is being ported to
the PC because it's THAT good. Hmmm, Netscape and Opera are in development
and nearing completion.

Quake and Myst on Atari?, Amiga has them available right now, licensed,
commercial versions. P133 performance levels on an 060/50Mhz Amiga, with
16bit video modes (PC only has 8 bit) and 100% compatible with the PC
version. Full networking support.

MP3 players/encoders, many freeware.

Freeware, shareware, PD... Check Aminet, it's HUGE.

  Please list the "facts" that this Atari user won't believe? (I also own
  2 Amiga's) ;-)

->And you obviously are no expert on Amiga OS, otherwise you would know TOS
->is and always has been the downfall of the Atari systems. The Falcon was a
->fine machine, except for that pathetic excuse for an OS.

Bad marketing and inept leadership was the downfall of Atari Corp., but Atari systems themselvs are fine. TOS versions from 2.06 and up (esp. the Falcon versions) are very well featured, stable, and intuitive...

->Yes, but where can you buy a real, brand new Atari???

Several places...there are Milans, Medusas, Eagles, C-Labs MKX series, and more...

->Atari is dead, but the Amiga has survived... and you can still buy new
->machines.

As long as hardware is still being produced, and software is still being released, then its not dead...

->In fact demand for new A4000T's outweighs supply, and there is a waiting
->list.

C'mon Clockmeister...thats not the whole truth and you know it. I also subscribe to Amazing Computing (fine mag, BTW), and while there is demand, and there is a short supply, the biggest reason for the shortage is the fact that QuickPak and Escom are currently in dispute!

->FYI, there have been, and are Amiga clones - Draco being one, and a new
->English made one who's name escapes me. There is also a WebTV type thing
->marketed in asia which is based on Amiga technology. (officially licensed)

No argument there.

->How many companies are there still developing hardware/software for the
->Amiga platform compared to the Atari?

The Amiga does enjoy much broader world-wide support, and I'll be the 1st to admit it. However, there are still several companies that support TOS users...and they appear to be very dedicated to the TOS market. Something else worth mentioning is that the software is of very high quality.

Both Platforms have their problems in an Intel/Microsoft dominated world.

(didn't -2- major Amiga magazines, one in France, and one in the UK, just close down?)

Here's to hoping that 20 years from now, there are still users like you and me to defend both Atari and Amiga systems! ;-)

Me too. Let's face it, each computer found it's niche in the market and
deservedly so.

Anyway, Beam & Coke for me...

Regards,

Clockmeister.

BTW, TIFKAS?

I don't think it's right to judge both machine solely on the basis of who made it. After all, as you can read at Curt Vendel's excellent www.atari.nu, and other locations who have something about computing history on the net as well, both systems have their merits and intermixed Atarian / Commodorian heritage. Many Atari engineers that worked on the Atari 8-bit home computer systems went to work on the joined Amiga Lorraine project by Amiga Technologies, a company which was later bought by Commodore when in turn, it's founder Jack Tramiel bought the home computer division of Atari and was followed by many former Commodore engineers. So in essence, one could say that the ST and its succesors descended from the Commodore 64, and the Amiga from the XL/XE, in a way (there even was an Atari Amiga planned under the name of 1850 XL). This mixing continued right on to the Atari Falcon, which, with all due respect, defeated the new Amigas in allmost all areas, mainly thanks to its built-in 16-bit ADAC and its universally programmable and expandable Digitial Signal Processor with its own direct connection both internally and to the outside world, which essentially provided some sort of multi- even parallel-processing possibilities (altough not as vast as the Atari Transputer Workstation, which used Inmos T800 transputers, the same technology later used by IBM's Parallel Transaction servers).

The Amiga was used primarily by graphic designers, animators, TV subtitlers and game players. The ST was more dominant in desktop publishing and music production because of its built-in MIDI-port and suitable display resolutions, as well as value for the buck. However, the ST's main succes was in Europe. In the United States, the DTP market was dominated by the Apple Macintosh.

Operating System.
AKAIK, the Amiga has its own operating system which supports pre-emptive multitasking, but has indeed its instability problems. There's a Unix for the Amiga, and for Webbrowsing there's Lynx and Opera, and also, BeOS seems to be developed for it.
For the Ataris there's Linux, Minix, OS/9, SMS2, TOS, MultiTOS (both of which have been bought by Milan Computer www.milan-computer.de and are being redeveloped and improved), MagiX (old MagiC), Geneva, MagiC, the last one being the most evolved and most modern version. There also used to be a vast amount of PC and Macintosh emulators for the Ataris. The PC emulators were usually slower than real PC's, the Mac emulators were faster.

CLONES
The ST, and it's successors, was indeed cloned at least three times, or otherwise built through licensing. Licensed machines included C-lab's own version of the Falcon and a machine called the Sonovista (which had multiple DSP's). Clones included the GE-Soft Eagle (with support for PowerPC), the Medusa, the Milan (www.milan-computer.de), the Hades and the prototype Phenix. The Medusa was born in Switzerland, the Phenix in France and the others in the Federal Republic of Germany. Then I believe there is some development at www.wizztronics.com All of these were not mere emulations, but real machines. If you want to include emulations, there are hardwarebased Janus (which runs on PC's running OS/2, DOS, or any Windows), half hardware/half software or all-software based Gemulator (www.emulators.com) and all softwarebased emulations PacifiST for games and STonX for Unix machines. There are also ports of Atari

TOS/MultiTOS-compatible operating system MagiC for PC's (called MagicPC) and Apple Macs (MagicMac) and Apple PowerMacs (MagicPPC).

PROFESSIONAL SOFTWARE SUPPORT

On the Amiga, I know Scala, a multimedia app now also ported to PC's as "MM2" with its own operating system to directly access the PC hardware.
On the Atari, Cubase, Notator, and Logic were born. I believe new versions still come out for Atari first. The only AMiga with built-in MIDI ports is the CDTV, I believe. (Ofcourse, you could always buy an MSX2 machine).

I have no experience with the Amiga community, but keep hearing stories about flaming & such. In the Atari community, I rarely encounter it, well except perhaps in video gaming newsgroups concerning the 64-bit Atari Jaguar system of 1993. Just ignore those flames.

You want some good advise? Ask yourself what you intend to use your computer for, and which computers do it best, which do it cheapest and which do it with best value for money. As for expandability: the higher-end Atari models all feature either VME-buses, or in case of clones, PC-type ISA and PCI buses. All low-end models feature at least a cartridge connector which has been known to support quite a variety of peripherals and expansions. As for hard disks: newer Ataris support the cheap PC IDE standards and its varieties, and all support SCSI, SCSI2 or SCSI through an adapter. Most current Atari systems or clones also support a variety of displays. But those are the things you worry about once you have made up your mind.
Considering that gaming is mainly a PC business to date, I'd say unless you run a TV studio there is not much point in buying an Amiga other than Nostalgia. As for MIDI on the PC: the Atari versions are still a lot more stable than their PC counterparts and chaper than their Mac counterparts. If you go into DTP however, Mac is still the way to go.

All in all, IMHO, you have to make up your mind first and ask others for their experiences in using the system for a set purpose. Ask them how much it cost them, and how well it works. Then decide.

I hope I've been able to help.

Sorry..couldn't pass this one by, now, regarding Q5's recent posting on Amiga Vs Atari.AFAIK the Atari's main strength was it's built-in MIDI port...hence it's niche was mainly with muso's etc etc. The Amiga (in no small part due to the NewTek Video Toaster and Lightwave) was supreme in the field of low cost, high quality video work.Q5 is correct in saying both machines to share a kind of common history (Jay Miner) etc etc but the buck stops there. Now..the Falcon seemed to be a sweet enough machine..I have never seen one so I can't say for sure, but the designed/built but never released Amiga 3000 + (AGA) with DSP etc would have eaten it for breakfast. The Amiga has a brilliant pre-emptive multitasking Operating System that does not! show any untoward stability problems contrary to Q5's opinion. Other supported Operating Systems are MacOS (68k right now but PowerMac soon) Various Unix variants....NetBSD, Linux68k, PPCLinux, even a debian port. You can even run Windows 3.1 or 95 (albeit very slowly indeed) Since the arrival of PowerPC add-on cards for the Amiga the big thing has been 100% PowerMac compatibility which is promised via FusionPPC (avail real soon)....the other 2 main 68k series cpu Mac emulators (Shapeshifter and Fusion68k) both boast better-that-"real-Mac speeds, but the PC emulations are slower due to on-the-fly cpu instruction transcription.. The Amiga gives you a GUI and a shell, the best of both worlds, plus it's still in active development and has been purchased by Gateway2000. I must confess I'm unsure of the Atari's present situation, but I suspect it's a dead platform with no new machines planned or being manufactured now, but I must stress I don't really know about that..I'm probably wrong there. The Amiga is being cloned right now...go to the Amiga Web Directory for more info on that, and it's also currently available with a choice of cpu's..from the humble 68020 right up to the 233Mhz 604e PowerPC with a 50 Mhz 68060 co-pro. You can run Amiga s/ware on a PC via the Universal Amiga Emulator (slow..clumsy but works), although I'd just stick to a "proper" amiga myself..:-) AS for Professional Software Support, let me say..it's all there mostly for the Amiga. YOu can get a variety of browsers (no..we don't use Lynx Mr Q5!)..Ibrowse, Aweb with Java, Voyager, with things like Opera and Netscape on the way....Imagine manipulation, Trackers..sound sampling....music..graphics...rendering....DTP....Word Pro...you name it..the Amiga most likely has it..so don't be scared into thinking there's nothing available on the platform. MIDI is avail for the Amiga.has been since the year dot..although not as good as Atari I expect .the new Prelude Soundcards offer extremely good MIDI by all accounts..plus the usual like high speed serial ports, DSP etc etc. The Amiga conforms to standard IDE and SCSI interfaces.....so there is no probs connecting that new HD, scanner or whatever. YOu even get to choose...you want SCSi I, II, Wide, Ultra? 24 bit graphix at crazy res is avail via things like the Picasso Iv card, the CVPPC card based on the Permedia II chipset....CV3d etc etc..Video modules, TV in a window..etc etc.. Better than CD quality CD sound, Framegrabbing..genlocking....you name it. Anyway, I'd like to stress I don't mind the Atari, I had a ST for years, but Q5's post was very biased indeed....so here I am going out to battle to set the record straight.....btw..it was once said that an Atari was simply an Amiga with all the cool stuff taken out!.....*ok, ok..I'm sorry* Anyway.....rant ends now....hey!..'least it ain't a PC, right?...;-)

>Steve Jobs would assert..Yesteryears technology for todays price..

Until you learn to appreciate its openness. If you don't want it, you could always hack it into a PC-contemptible. Does an Atari need multi-billion terabytes for its software to run smoothly, elegantly, and most of all, functional and bugless? Does it need a 128MB memory to run this software? No. Could it use 128MB's? Ofcourse it can. But why use it if you don't need it.

>
>>   my assertion has nothing to do with what the public buys, but from

>Epson printers and USB stuff. Nope..You can pick one up at one of the
seven
>Computer City ones - I wonder I get to go up north...Plus the countless
>resellers..

Well, in Germany and the Netherlands I did hear rumours about someone making those LS-120 drives (surpassed by Fuji's 200MB HiFD drive btw) connectable to Ataris. Even using a parallel port. Erm... come to think of it.. why don't you just look up the lates version of HDDriver. And last but not least - why would I WANT to connect a mass storage device to a parallel port when I have SCSI at my fingertips?

>Funny, I did not see a milan or hades at Comp and Computer City recently.

I don't see any iMacs in European retailstores either. What was that again you said about yesteryears technology?

Oh btw - did you EVER find out where Steve Jobs started out? Check out Curt's www.atari.nu

And last but not least: didn't he also have a thingy called the NeXT with operating system NeXT Step? Remind me how much a NeXT _used_ to cost in comparison with say, an Acorn RISC PC or Archimedes? Are the NeXT boxes still around? Are Ataris still around? Are NeXT boxes being cloned? For how long was the Mac being cloned? For how long could you have used an Atari to run Mac software using the Spectre GCR? Hmmmmm. Since you have all the answers, I think I speak for many that we would love to hear from you (or not).

:-) Cheers

In addition, why would anyone WANT a USB keyboard or a USB mouse? Do I need a faster keyboard? It keeps up with me just fine you know. If they want USB, they should promote it using ADSL modems and such, not keyboards and mice. Geez.... Yeah lets hook up EVERYTHING to one serial bus. All peripherals, including the priority ones like controllers. That will increase you performance, and decrease a chance of faults, glitches, sluggish response and such.

Why? So we can run our Atari software using MagicMac, to keep the MacOS out of it. To heavy on resources. Geez people. I don't mind seeing an occasional Mac posting, but let's not forget our identities here. This is comp.sys.atari.advocacy isn't it? So Peter, if you have something useful to contribute to us, feel free to post. If not, why bother? Has Apple become so arrogant and desperate that it needs us Atarians to all buy Macintoshes in order to survive? Because we are more easily convertible than PC-contemptible owners do? Should we join Microsoft?

Come' on, everybody can make their own choice. But if you want to convince us, you'll have to promise that Apple buys and licenses all Atari technology from Hasbro and starts making Ataris again. Or send me a Mac for Christmas. I am not a Mac-hater. Actually, I love Macs over PC's. But I think that it is important that we all have the right to our own ideas, feelings, likes and dislikes. So, a bit more diplomacy in postings and replies would be advisable, I think.

Nevertheless, it never hurts to stirr up some discussion (in a civilized manner). What does it accomplish to get flamed?

I hope this provocative posting might ease everyone a little bit. Let's talk not terrorize.

Werner Domroese / Q5

So on this we agree :)
 Now..the Falcon seemed to be a sweet enough machine..I have never seen one
so I can't >say for sure, but the designed/built but never released Amiga
3000 + (AGA)
>with DSP etc would have eaten it for breakfast. The Amiga has a brilliant

WOULD HAVE - the Falcon is not vaporware, but Available. As for the A3000, I believe that that one should have been compared to the planned but not released high-end Falcon, the Micro Box or Falcon 040 (ask Curt, he knows a lot more about it than I do).

>pre-emptive multitasking Operating System that does not! show any untoward
>stability problems contrary to Q5's opinion.
Who - hold your horses. What I meant, and admittedly poorly translated into words, to say was that there was somewhat of a "common belief" to this. I know people with Amigas who never complained about it, so there. :-) Let's not get hostile.

>indeed....so here I am going out to battle to set the record

Like I said, I did not mean to be biased and I said nothing whatsoever to take down any system. On the contrary. I am admittedly an enthusiastic Atari user, and I wish to augment my collection with Amigas(!). So there. Anyway, almost anything you can say about the Amiga regarding third-party software and hardware support is (I _think_), also true for the Atari, so you do have a choice.

Anyway, thank you for replying. But please, let's keep everything on a civilized and objective level. I clearly said _AFAIK_ (okay I misspelled AKAIK) because I wanted to indicate that I do not have enough experience in the Amiga scene to give exhaustive info on that. So I didn't. That is why there's more on Atari in there.

I hope this cleared things up. There's nothing like a good discussion. Now, err. can we go back to Non-Motorola bashing? *grin* ;-) (I'm sorry I just couldn't let it pass by...)

This is true

>Amiga also, and the Amiga soundchip had better sound quality then the Atari
>ST range.
Well, like the Amiga can have MIDI-ports retrofitted, so can the Atari have

audiocards retrofitted. They were just into different kinds of music. And if
I were to play games, I would prefer the Amiga yes. But when it comes to
MIDI, there were just (I think) more and better titles available at the time
for Atari. Ofcourse MOD files were the Amiga's domain to start with. But
both have earned their merits. And I think that at least with the
introduction of DMA-sound the STE's and TT's (50kHz 8-bit stereo) have
reasonably - admittedly too late - come back, and the audio qualities of
the Falcon (8-channel 50kHz 16-bit stereo DMA without using the DSP) are
certainly unqestionable. And for the clones, there's also an
(over-expensive) 24-bit studio audio card avaliable, somewhat comparable to
a SoundBlaster Live I think. (I have to look up the FAQ of that audio card,
it's available over here in the Netherlands though).
>
>The reason that the Falcon failed so miserably was BECAUSE of TOS.

No. The main reason IMHO was the dispute between Jack Tramiel and German
Atari-head Alwin Stumpf. Tramiel wanted to go into consumer market, Stumpf
into the professional one. Most people hoped for a better Falcon casing and
presentation. Support was just cut off right after the introduction of the
MicroBox prototype (68060 Falcon with a couple of VME and/or PCI slots).
Then suddenly, Atari decided to focus on and market their Jaguar system
(64-bit RISC game console, 1993). Ofcourse, Atari and marketing under the
Tramiel reign... especially in Europe? I don't know - no comments....

What kind of petty stuff is this? Why not develop a common environment for
both Amigas and Ataris (without necessarily resorting to Minix or Unix /
Linux). Would be
nice. A common Motorola-platform could give some weight against the Wintel
monopoly. And how about portable stuff? The 3Com Palm Pilot III uses a 68K,
doesn't it?

Erm.. CD-i tried it also...
>>
>The CD-TV was introduced ahead of it's time. Kin ya say DVD???

CDTV was far more advanced than DVD IMHO. It's not reallyt comparable. The
CDTV was a real computer, like the CD32. And the first Falcons were
supposedly meant to be designed that way also, or so is rumoured, but
redesigned around the old 1040 casings in stead, having seen how popular
CD-I got and how popular 3DO got to be. *sigh*
>
>WebTV sucks, but they chose Amiga technology and OS for it's flexability

You clearly have not dug into TOS, have you? Are you talking disk-based TOS
1.0? How about MagiC? They probably chose Amiga OS because it has proven
itself in multimedia applications for years and because it provides a viable
platform to easily port existing multimedia ideas. (Or so I guess).

Check out Myst for the Jaguar. As for Quake, the Atari has other FPP's. The
Falcon
has 16-bit video support. PC-version was there first, but I'd love to try it
on an
Amiga. I'm not that hungry for Quake though. It's personal I guess.

>
>MP3 players/encoders, many freeware.

Surround sound ENcoders (okay so it's Falcon only)

Wouldn't it be nice to have native Amiga AND native Atari stuff in one box?
What could have happened had Atari and Commodore cooperated on their 68K
stuff. Hmm getting wild phantasies now... I think they would still compete
bigtime against Wintel.

>is and always has been the downfall of the Atari systems. The Falcon was a
>fine machine, except for that pathetic excuse for an OS.

I don't know. I guess it depends on what you compare it to, and what you pay for it. (It too adds to the cost of hardware you know). But perhaps you are just referring to the GUI, which was originally developed by Digital Research for PC's on an Intel-basis as GEM "Graphic Environment Manager", you know the people that made CP/M. This GEM had to be redone for 68K. All of this long before Windows or any other PC GUI's saw the light of day. It's pretty newbie-friendly though, and all versions above 1.0, except the multitasking ones, completely diskless (e.g. in ROM). I've heard that TOS itself (not the GEM) had many ties internally with C, which would make it flexible enough (although not speedy) to port and modify. MultiTOS for example, or should I say, MiNT, had some Unix-like features if I recall correctly. Again, it would've been nice had Atari and Commodore come up with a common OS. Didn't the ATW 800 feature a parallel processing modified TOS???? Could be mistaken though. Anyway, if you're not satisfied with TOS, try MagiC (or wait for the new TOS by Milan Computer).

Regards,

Werner

>don't

All of which is also available on Atari, ESPECIALLY on Falcons.
>>mind the Atari, I had a ST for years, but Q5's post was very biased
>>indeed....so here I am going out to battle to set the record
Like I said, I only said what I know of. I am admittedly no expert on Amigas and therefore simply feel that I cannot state anything to give it the credit it deserves (Why You did that, as anticipated). I did not bring it down either, and if I did, I apologize for that. It is people like you and me that remind people that they have a CHOICE.
The whole POINT of my message was to get people to THINK and make up their own minds. I even said, ask other people (which includes you). And so you made your point, actually, in a very ironic way (read my message carefully), you made mine.

So what are we arguing about? I am not questioning the validity and support of the Amiga. I was simply pointing out that there is a lot to consider in

such matters, with everyone having their own preferences and also stating
that the Atari platform is by no means "dead", or at least equally dead as
other 68K-originated platforms, including the Amiga.

Hope that clears things up as well :-)

And have been long before Amiga clones. Medusa T40 and T60, Eagle, C-Lab
Falcon, Sonovista, Hades, Milan (www.milan-computer.de) - readily available
throughout the Benelux and Germany, Phenix (www.centek.fr), and all in
different varieties.

There also have been various 68030 accelerators for years for the ST even
some that specifically cooperated with certain Mac emulators.

Really? I always thought that the launch of the ST was intentionally delayed
to await the publics opinion of the A1000? Or was that the 1040 ST??

> That situation was heavily reversed when the A1200 and Falcon were
> released. Do a spec comparison, the Falcon is heads up on the A1200. ;-)

We all agree on that :-)
It has been possible to run Windoze on the Falcon in full color as well by
the way. But who would want that? Creators of emulators have never really
gotten the point. Yes it would be nice if you could use other computer's
software on yours, but do you have to get stuck with the other's operating
system and interfaces as well? No thanks...

Fair on who. All I read was a heap of Atari propaganda. You obviously know
nothing of the Amiga, otherwise the story would read quite different.

Amiga for nostalgic reasons only???
At least the Amiga still has some users.

You just made someone else's point about helpful users and flamers :-)
I don't think I need to reply to this. After all, I did stress openly that
it is BECAUSE I don't know much about the Amiga scene that I don't write
anything about it. That's why there's so much Atari stuff in that message.
Now do you understand? I also stressed that I was not (well at least not
intentionally) attacking anything or anyone. Geez... I think you're really
missing the point and reason of the whole message.

Well, enough said. I don't think I want to reply to this stuff anymore...

Would it? Looks to me like you're starting an "Amiga is better than Atari" thing. I did no such thing. And You don't know me at all, let alone my background, or even if I'm a guy or a gal. So, how dare you judge me?

Don't get personal or flamy. Everything is mostly IMHO, or sometimes IMNSHO, and based on what I know as facts. I did not include any fancy Amiga stuff because I am not aware of the current status. It's been awhile since I've been around in the respectable Amiga-scene, and obviously, the same is true for you on Atari things (from what I've seen you post so far).

I also used to subscribe to a couple of local Dutch Amiga magazines, and know many people who own an Amiga or used to program it in assembly language. I just have different preferences, yes, that's true, but I still want to add Amigas to my collection and I have no disrespect for the platform. That does however not mean, that I am not entitled to correct anyone claiming false or at least questionable info on Atari.

Those were my last two cents to you, have a nice life and please - feel free to troll if you will, I'm not going to rush out and say that the Atari platform is dead until I truly believe it is.

And then there's the ex-Amiga developers who developed the Suzy and Mikey
custom chips of the Lynx. The Lynx Developer Kit even consists of an Amiga
with a Howard board, so there...
>->Falcon seemed to be a sweet enough machine..I have never seen one so I
can't
>->say for sure, but the designed/built but never released Amiga 3000 +
(AGA)
> I read the specs for it one time, and it did look good. Too bad that big
C failed to release it. You should match it up against the unreleased 68040
Falcon from Atari (Microbox). ;-)

Exactly. Atari too has released big box machines, you know... And many were
unreleased that's also true, but they were not all unreleased...
>
>->with DSP etc would have eaten it for breakfast. The Amiga
Since it was never released... did you read the MicroBox specs? How can you
be sure of never released hardware if you didn't test it?
> Multiple alternative OS's are also available for TOS computers... ;-)

..and half a dozen the same as for the Amiga...
And DOS and stuff like that could be run through emulation on Ataris even in
the early 80's, so it's really nothing new to us Atarians.
>->been purchased by Gateway2000. I must confess I'm unsure
after it first had gone bankrupt, then bought by Escom which in turn went
bankrupt, then bought by Tulip, which almost went bankrupt, and lastly by
Gateway 2000, who seem to have decent plans for and releases of Amiga
technology.
of the Atari's
>->present situation, but I suspect it's a dead platform with no new
machines
>->planned or being manufactured now, but I must stress I don't really know
>->about that..I'm probably wrong there. The Amiga is being
Indeed... Atari's been split up before. The name now belongs to Hasbro after
Atari Corp first merged with JTS, which did nothing with it. The TOS
operating system and the technology of the Falcon and its predecessors now
largely belong to C-Lab and Milan Computer, who are actively building and
selling machines. If you want one I can order you one.
>
> There are multiple TOS clones out, with still more coming. The Medusa,
> Eagle, C-Labs Falcon MKX, and DirecTT have already been released. The

Yes I know AGA, yes I know Denise yes I know halfbrite, HAM, SuperHAM, The FusionPPC (read about it in several Amiga mags) and all kinds of other stuff. That doesn't mean that those kind of developments don't exist for Atari. It also doesn't mean I purposely did not include it. I am not an expert on Amigas therefore I avoid putting things in there that I'm unsure of, unlike you, since you claim the Atari platform to be dead and Atari users to be non-existant. Then what am I? Did you ever read any other Atari newsgroups? Perhaps you should stick to Amiga newsgroups if you don't like me, 'cause I'm not shying away just because of an unjust personal grudge.

Look, I have experience on almost every conceivable computer and console platform on this planet, so please don't get personal.

I still believe I have been as fair as I could have been and even if I weren't, this is still comp.sys.ATARI.advocacy, isn't it?

Geez I can't believe I'm actually still replying to this. I respect both the Amiga and the Atari, I just know a little more about the Ataris, that's all. Everyone: make up your own mind, but don't enforce it upon others, please!

Hey buddy, take it easy dude!
My remarks were in no way intended to insult you. If they did then I'm sorry.

But the following statements sounded like they were implying that the Amiga

was incapable/inferior to the Atari. Better research would reveal it to be not the case at all.
In any event, whichever platform one chooses to use is a matter of personal preference. At least WE (united) don't use Wintel!

I don't think it's right to judge both machine solely on the basis of who made it. After all, as you can read at Curt Vendel's excellent www.atari.nu,
and other locations who have something about computing history on the net as
well, both systems have their merits and intermixed Atarian / Commodorian heritage. Many Atari engineers that worked on the Atari 8-bit home computer systems went to work on the joined Amiga Lorraine project by Amiga Technologies, a company which was later bought by Commodore when in turn, it's founder Jack Tramiel bought the home computer division of Atari and was
followed by many former Commodore engineers. So in essence, one could say that the ST and its succesors descended from the Commodore 64, and the Amiga
from the XL/XE, in a way (there even was an Atari Amiga planned under the name of 1850 XL). This mixing continued right on to the Atari Falcon, which,
with all due respect, defeated the new Amigas in allmost all areas, mainly thanks to its built-in 16-bit ADAC and its universally programmable and expandable Digitial Signal Processor with its own direct connection both internally and to the outside world, which essentially provided some sort of
multi- even parallel-processing possibilities (altough not as vast as the Atari Transputer Workstation, which used Inmos T800 transputers, the same technology later used by IBM's Parallel Transaction servers).

Pity about the OS though... AmigaOS supports paralell processing, even KS1.3 supported it. That capability is being used very successfully with the 060/PPC combos. Little know fact is that AmigaOS was the first to support this on a home computer/OS.

The Amiga was used primarily by graphic designers, animators, TV subtitlers and game players. The ST was more dominant in desktop publishing and music production because of its built-in MIDI-port and suitable display resolutions, as well as value for the buck. However, the ST's main succes was in Europe. In the United States, the DTP market was dominated by the Apple Macintosh.

Wasn't that a great time... Many different platforms filling different niches in the market...

Operating System.
AKAIK, the Amiga has its own operating system which supports pre-emptive multitasking, but has indeed its instability problems.

Thing of the past. Anything from WB2.0 up is pretty damn stable, moreso then Win95/98 or MacOS.

There's a Unix for
the Amiga, and for Webbrowsing there's Lynx and Opera, and also, BeOS seems to be developed for it.

Lynx???, who uses that?
Try IBrowse, Voyager, soon Opera, Netscape is being developed, and quite a few others.

For the Ataris there's Linux, Minix, OS/9, SMS2, TOS, MultiTOS (both of which have been bought by Milan Computer www.milan-computer.de and are being
redeveloped and improved), MagiX (old MagiC), Geneva, MagiC, the last one being the most evolved and most modern version.

Most of these were developed because of TOS/GEMs limitations.

There also used to be a vast
amount of PC and Macintosh emulators for the Ataris. The PC emulators were usually slower than real PC's, the Mac emulators were faster.

The Amiga has an emulator for just about anything on the market. Do you know of the ST emulator that ran on standard A500's?. Quite useable speeds too.

CLONES
The ST, and it's successors, was indeed cloned at least three times, or otherwise built through licensing. Licensed machines included C-lab's own version of the Falcon and a machine called the Sonovista (which had multiple
DSP's). Clones included the GE-Soft Eagle (with support for PowerPC), the Medusa, the Milan (www.milan-computer.de), the Hades and the prototype Phenix. The Medusa was born in Switzerland, the Phenix in France and the others in the Federal Republic of Germany. Then I believe there is some development at www.wizztronics.com All of these were not mere emulations, but real machines. If you want to include emulations, there are hardwarebased Janus (which runs on PC's running OS/2, DOS, or any Windows), half hardware/half software or all-software based Gemulator (www.emulators.com) and all softwarebased emulations PacifiST for games and STonX for Unix machines. There are also ports of Atari TOS/MultiTOS-compatible operating system MagiC for PC's (called MagicPC) and
Apple Macs (MagicMac) and Apple PowerMacs (MagicPPC).

Much the same story for Amiga here...
Check the English magazines for Amiga clone details, or buy a brand new Amiga perhaps...

PROFESSIONAL SOFTWARE SUPPORT
On the Amiga, I know Scala, a multimedia app now also ported to PC's as

"MM2" with its own operating system to directly access the PC hardware.

Lightwave, ImageFX, Dpaint3, The infamous Toaster/flyer... numerous more, with new apps appearing monthly.

On the Atari, Cubase, Notator, and Logic were born. I believe new versions still come out for Atari first.

Some of the above (if not all) were never seen on Atari... (the Amiga apps that is)

The only AMiga with built-in MIDI ports is the CDTV, I believe. (Ofcourse, you could always buy an MSX2 machine).

I'm not even sure about CDTV, but a $20 adaptor fixes that problem anyway. You did know that the Amiga has extra pins on the serial port (the ones that are usually not used) are used for various Audio I/O didn't you?

I have no experience with the Amiga community, but keep hearing stories about flaming & such.

Just stories... If you call defending a platform flaming then you are right. But self defense in itself doesn't equate to a flame in my eyes at least.

In the Atari community, I rarely encounter it, well except perhaps in video gaming newsgroups concerning the 64-bit Atari Jaguar system of 1993. Just ignore those flames.

Amiga people in the newsgroups are very helpfull in answering Amiga related questions. Sure, there are some blind fanatics who will swear that an A500 is better then a Pentium II, but these people don't frequent Amiga newsgroups.

You want some good advise? Ask yourself what you intend to use your computer for, and which computers do it best, which do it cheapest and which do it with best value for money. As for expandability: the higher-end Atari models all feature either VME-buses, or in case of clones, PC-type ISA and PCI buses.

Some Amiga models have both Zorro II/III and PC/AT slots, all have Zorro capabilities.

All low-end models feature at least a cartridge connector which has been known to support quite a variety of peripherals and expansions.

As is the case on Amiga, starting from the A1000.

As for hard disks: newer Ataris support the cheap PC IDE standards and its varieties, and all support SCSI, SCSI2 or SCSI through an adapter.

Big box Amigas had either SCSI or IDE as standard, although the A2000 did come out as a floppy only model, and SCSI was an option. Harddrives are available on ALL models, mostly SCSI.

Most
current Atari systems or clones also support a variety of displays.

As does Amiga. Graphics cards, have been, are, and are being developed for the Amiga, and certain Multisync monitors can be used with any Amiga, whilst a flicker fixer is required with others.

But
those are the things you worry about once you have made up your mind. Considering that gaming is mainly a PC business to date, I'd say unless you run a TV studio there is not much point in buying an Amiga other than Nostalgia.

This comment isn't fair at all. I could say unless you are into MIDI there is no point in buying an Atari at all, except for nostalgia.
Just as valid as your comment...

As for MIDI on the PC: the Atari versions are still a lot more
stable than their PC counterparts and chaper than their Mac counterparts.

There is one thing you don't quite seem to understand. MIDI is better on Amiga then on PC too, with the suitable MIDI adaptor. You only need to look at the software that was ported to the PC to see that. I DO agree that an Atari is better in this regard, but the difference in reality is not that great.

If
you go into DTP however, Mac is still the way to go.

That does seem to be the case.

All in all, IMHO, you have to make up your mind first and ask others for their experiences in using the system for a set purpose. Ask them how much it cost them, and how well it works. Then decide.

Agreed, but a balanced view is required. For instance, it's no good coming into an Atari newsgroup with a question like which is better at XXXXXXX Atari or Amiga.
Instead, wording the question as: What are the Ataris capability at XXXXXX
Then, go to an Amiga newsgroup and ask them the same question. Compare the results, and choose for yourself.

Well, there are my remarks. I tried to be as fair as possible.

Regards,

Clockmeister.

I used the American term (I believe) goodwill to describe the same thing
here in Australia. Amigas have held their value very well in this country,
but Ataris haven't.
I had to sell my 1040STfm for $20, simply because I couldn't get any more
for it but to buy an A500 would set you back $75 at least. All big box
Amigas have remained popular, as well as the A1200 and hence the price has
remained relatively high.

Early Macs sell for around $20 -$40 dollars.
XT's, well, you can't give them away and
286's are worth $10 + monitor (depending on type, EGA or VGA) $20 max.

The last 386 Tower with VGA monitor, mouse, 8Mb RAM, 3.5" 1.44Mb floppy and 80Mb HDD cost me $25.

I think that pretty much sums up the value of older PC's I guess...

Regards,

Clockmeister.

->Really? I always thought that the launch of the ST was intentionally delayed
->to await the publics opinion of the A1000? Or was that the 1040 ST??

Okay, IIRC, the original Atari 520ST beat the Amiga A1000 to market by around 6 months or so. The 1040 was released later, and even made the cover of Byte magazine, as the first home computer to be released with 1 meg of Ram standard. ;-)

Finally, a decent message. So it's possible :-) I guess al you say is true for Australia. In Europe, the Ataris have always been more popular than elsewhere (also reflected in more worldwide spread of Amigas than Ataris, that's true). However, as we both demonstrated in this thread, both the Atari and the Amiga community are still very much alive. And as long as people like you and I still exist to jump in defense of the very existence of these systems and their (to some extent common) heritage, they will not be dead and shall not go quietly. (They both made history).

Ataris retained more value in Europe than alsewhere. But what do I care? If someone wants to sell me an Atari for an amazingly low price, than I have little problem with that. Usually, truly happy Atari users are either upgrading or sticking with their systems, not sidegrading... (although I must admit I do have a Wintel machine purely for professional reasons, which also has its merits - but, I sure as h*ll did not part with my "A-team (Atari/Apple/Amiga the latter two to still be purchased at a later date)" and I never will unless someone threatened my life with a gun to my head...

Werner Domroese / Q5

PS - The PC (Pretty Contemptible? ;-)pricing's about the same here in Europe (Netherlands), wouldn't know about Mac.

You just didn't get it. USB is not meant to be "faster", it's meant to be "easier", which means devices can be hot-swapped, and are truly plug and play (which is currently the case with ADB devices for Macs, but not true for most devices on PCs).

Apple didn't go for USB on the Mac because it's FASTER, but because it's EASIER, and mind you, it's the future.

That presumes that it needed to be easier to begin with.
USB is considerably slower than other available options

while delivering little in the way of real benefit except
perhaps requireing the user to buy a bunch of new equipment
(at extra cost) and multiple hubs (also at extra cost).

Actually, USB looks remarkably like the past, a past that
many of us were glad to see gone.

It's hard to argue with this statement when you use the word "needed". In this context, how do I decide between what is "needed" and what is "wanted" or "desirable"?

> USB is considerably slower than other available options
> while delivering little in the way of real benefit except

USB is cheap. While using USB to connect your printer or scanner is not the fastest solution, it is an easy and cheap solution. Ethernet printers are still fairly expensive and many new PCs only have a single parallel port. Also, USB is meant to connect keyboards, mice, joysticks, tablets, gamepads, etc. You don't think that USB is appropriate for these devices?

I couldn't decide if you meant that ADB is hot-swapable so I'll point out that it is not. Also, USB PnP is much better than ADB PnP because there are serious device uniqueness problems with ADB.

I have to agree with this.

FYI, Mr. Amiga, Myst has been available for Atari since the Jaguar CD VGS. Amiga sucks. WebTV sucks, but I use it. If it were based on an Atari platform, it would have greater potential.

A lot of Ataris problem was that they didn't get the Home Computer market they deserved as many people saw them as a Video Game Producer

and therefore unable to make a real computer. I like my Atari 800XL and my Commodore 64 equally well; I grew up with a Commodore 64 yet I like the 800XL's features a lot more. Macs and iMacs can all crash and burn in hell, and I hope someone with sense takes over Microsoft someday.
All for now.

On 17 Sep 1998 21:43:28 , Mikhol74 wrote:
Could someone please give me the pros and cons of the both the Amiga and Atari ST? Thanks.
I don't think it's right to judge both machine solely on the basis of who made it. After all, as you can read at Curt Vendel's excellent www.atari.nu, and other locations who have something about computing history on the net as well, both systems have their merits and intermixed Atarian / Commodorian heritage. Many Atari engineers that worked on the Atari 8-bit home computer systems went to work on the joined Amiga Lorraine project by Amiga Technologies, a company which was later bought by Commodore when in turn, it's founder Jack Tramiel bought the home computer division of Atari and was followed by many former Commodore engineers. So in essence, one could say that the ST and its succesors descended from the Commodore 64, and the Amiga from the XL/XE, in a way (there even was an Atari Amiga planned under the name of 1850 XL). This mixing continued right on to the Atari Falcon, which, with all due respect, defeated the new Amigas in allmost all areas, mainly thanks to its built-in 16-bit ADAC and its universally programmable and expandable Digitial Signal Processor with its own direct connection both internally and to the outside world, which essentially provided some sort of multi- even parallel-processing possibilities (altough not as vast as the Atari Transputer Workstation, which used Inmos T800 transputers, the same technology later used by IBM's Parallel Transaction servers).
The Amiga was used primarily by graphic designers, animators, TV subtitlers and game players. The ST was more dominant in desktop publishing and music production because of its built-in MIDI-port and suitable display resolutions, as well as value for the buck. However, the ST's main succes was in Europe. In the United States, the DTP market was dominated by the Apple Macintosh.
Operating System.
AKAIK, the Amiga has its own operating system which supports pre-emptive multitasking, but has indeed its instability problems. There's a Unix for the Amiga, and for Webbrowsing there's Lynx and Opera, and also, BeOS seems to be developed for it.
For the Ataris there's Linux, Minix, OS/9, SMS2, TOS, MultiTOS (both of which have been bought by Milan Computer www.milan-computer.de and are being redeveloped and improved), MagiX (old MagiC), Geneva, MagiC, the last one being the most evolved and most modern version. There also used to be a vast amount of PC and Macintosh emulators for the Ataris. The PC

emulators were usually slower than real PC's, the Mac emulators were faster.

CLONES

The ST, and it's successors, was indeed cloned at least three times, or otherwise built through licensing. Licensed machines included C-lab's own version of the Falcon and a machine called the Sonovista (which had multiple DSP's). Clones included the GE-Soft Eagle (with support for PowerPC), the Medusa, the Milan (www.milan-computer.de), the Hades and the prototype Phenix. The Medusa was born in Switzerland, the Phenix in France and the others in the Federal Republic of Germany. Then I believe there is some development at www.wizztronics.com All of these were not mere emulations, but real machines. If you want to include emulations, there are hardwarebased Janus (which runs on PC's running OS/2, DOS, or any Windows), half hardware/half software or all-software based Gemulator (www.emulators.com) and all softwarebased emulations PacifiST for games and STonX for Unix machines. There are also ports of Atari TOS/MultiTOS-compatible operating system MagiC for PC's (called MagicPC) and Apple Macs (MagicMac) and Apple PowerMacs (MagicPPC).

PROFESSIONAL SOFTWARE SUPPORT

On the Amiga, I know Scala, a multimedia app now also ported to PC's as "MM2" with its own operating system to directly access the PC hardware. On the Atari, Cubase, Notator, and Logic were born. I believe new versions still come out for Atari first. The only AMiga with built-in MIDI ports is the CDTV, I believe. (Ofcourse, you could always buy an MSX2 machine).

I have no experience with the Amiga community, but keep hearing stories about flaming & such. In the Atari community, I rarely encounter it, well except perhaps in video gaming newsgroups concerning the 64-bit Atari Jaguar system of 1993. Just ignore those flames.

You want some good advise? Ask yourself what you intend to use your computer for, and which computers do it best, which do it cheapest and which do it with best value for money. As for expandability: the higher-end Atari models all feature either VME-buses, or in case of clones, PC-type ISA and PCI buses. All low-end models feature at least a cartridge connector which has been known to support quite a variety of peripherals and expansions. As for hard disks: newer Ataris support the cheap PC IDE standards and its varieties, and all support SCSI, SCSI2 or SCSI through an adapter. Most current Atari systems or clones also support a variety of displays. But those are the things you worry about once you have made up your mind. Considering that gaming is mainly a PC business to date, I'd say unless you run a TV studio there is not much point in buying an Amiga other than Nostalgia. As for MIDI on the PC: the Atari versions are still a lot more stable than their PC counterparts and chaper than their Mac counterparts. If you go into DTP however, Mac is still the way to go.

All in all, IMHO, you have to make up your mind first and ask others for their experiences in using the system for a set purpose. Ask them how much it cost them, and how well it works. Then decide.

I hope I've been able to help.

Werner Domroese

     At least they're available. Also, it's rather difficult to
     say whether that cost has any real bearing on the realities
     of cost.

>Also, USB is meant to connect keyboards, mice, joysticks, tablets, gamepads,
>etc. You don't think that USB is appropriate for these devices?

     When considering that they were being connected just fine
     before with lack of muss or fuss, NO. Having seen what can
     happen on a broadcast bus network when stations are mal-
     configured I have no interest in having either any of my
     high speed peripherals or my primary input devices attached
     to one.

     The question remains: just what was broken & why the pressing
     need to replace interfaces and devices that work perfectly well
     as is.

Well said......actually I hope I didn't give the impression I was "bashing" at all, I must say it was a bit late at night when I posted initially and, as per usual I'd been copping some flak from the usual mob of Wintel Wintendo "drones" about why if the PC isn't any good how come 85% of the ppl on the planet seem to have them *sigh* Of course, the same arguement applies to Eastern Bloc Trabant owners huh?..hehehe That's what a monopoly produces...:-) Anyway...sorry if I was a bit abrupt, I'm actually quite interested in the current state of the Atari, think I might have to look closer into it I think. I have a PC, the way things are these days it's really compulsory at times *groan* but I must say I can't really stand the thing, I try to do everything I can on my Ami or on the Mac emulator I use. I must say, the Mac heads are nearly as fanatical as us and they do get their noses a bit out of joint when they see me running Netscape, Duke 3d etc etc on my humble Amiga..hehehe Still, you're quite right, it is all about choice and I can respect anyone who chooses not to play "Follow the leader" when it comes to their computing platform. Lets face it, it's the Atari , Amiga and Mac users that are the last hold-outs from total M$ domination, so keep up the good work and hopefully we can give Gates and Co something to think about in the coming years..(well, that's the dream anyway!)Oh..for anyone who's interested, the Ami Web Dir URL is http://www.cucug.org/amiga.html

Atari, Amiga or Mac?...
Hmmm.....do any of those comps give you a "Bluescreen" with monotonous regularity?...cost you an arm and a leg every 12 months to follow the Wintel prescribed "upgrade path" and suffer from over 10,000 "undocumented features" ?...oh, and serve as cash cows specifically designed to line the pockets of the Devil incarnate ?..."no" I hear you say ?...

Then go for it!...:-)

>connector too? I wish people knew what "standard" means back in the 80s.

Just plug the mouse into an extra serial port if you have one.
The monitor issue was solved a long time ago. Everything else
(keyboard,disks,CD's, scanner,printer,modem, cable modem) I
could plug into any Atari with the appropriate ports. In fact,
I think my PC's floppy drive is the last working remnant of my
last STe.

It might be useful for a single device. However, for muliple
devices, effective bandwidth per device will very likely fall
to below where it would have been for a dedicated port. USB
is barely faster than a current EPP port.

Just a question, but what good will a USB keyboardbe to a Mac user if it isn't
a proper Mac keyboard? How would you operate all the shortcuts?

>   USB is slower than what? What are the other available options? The

Serial and parallel ports are fine for what they are supposed to do. I use a
serial port for connecting my modem, which works just fine (although mine
would need a buffer), and my friend runs a BBS as well as a network over his
parallell and serial ports.
Besides, the Mac has never had standard Centronics parallell ports, which
certainly didn't help+ compatibility, interoperability and speed when
connecting them to other micros and printers.

Rather an example of dated technology. What kind of hack would the Mac require
in order to utilise its inexistant parallell port?

>   USB is the future, a future I'm glad to see Apple is moving towards to.

It seems like a lot of unnecessary hot air to me. It is novel in some ways, of
course, but is also very limited ATM, and I'm not so sure about its future.

The computer world offers so many futures each month, you get a bit blas�
after a while.

Why, when I can already connect these devices to my existing micro, bought
five years ago?

Of course. So let's make them faster, but why replace the existing, tried and
tested RS-232 standard, for which droves of devices have been produced for two
decades, with something new, for which next to nothing exists in comparison.

>>>
>>>>   USB is considerably slower than other available options

>out there soon.

Parallell printers are all over the place now. In fact, one of them sits above
my computer.
The USB peripheral market is very small in comparison to industry-standard PC
interfaces.

>>>Also, USB is meant to connect keyboards, mice, joysticks, tablets,
>>>gamepads, etc. You don't think that USB is appropriate for these devices?
>>
>>   When considering that they were being connected just fine

>mouse port, a joystick port, etc. Wouldn't it be easier to have an
>universal connector, so _ALL_ computers (PCs, Macs, even ATARIs) could use
>the same devices?

I already have these ports and they all work, so why repair something which
isn't broken?
On the back of my computer I have:
* Non-standard PSU connector
* Standard coaxial RF output
* Standard RCA composite video output
* Non-standard DIN-23 monitor output, optional standard DIN-15 adaptor
* Standard stereo RCA audio output
* Standard DIN-25 Centronics parallell port
* Standard DIN-25 RS-232 serial port
* Standard Kempston DIN-9 joystick port
* Standard Kempston DIN-9 joystick port/non-standard mouse port

These all work, and have a wealth of peripherals available, so why would I
switch to USB, whose peripheral range is so limited?

Besides, why should I bet all my money on one horse? If my USB bus breaks
down, I will not be able to use my mouse, keyboard, printer, modem or
joysticks, whereas one burnt chip in my current system will probably only
result in losing one or two ports, making the computer accessible despite
failing ports.

Besides, how can PCs, Macs and Ataris share a common port and peripherals,
when USB is only available for a few PC and Mac models, and no Ataris?
Besides, since most of the PC, Atari and Amiga ports are fairly standardised,
the compatibility problems do usually boil down to lack of drivers and
software support, not incompatible ports.

>>   The question remains: just what was broken & why the pressing
>>   need to replace interfaces and devices that work perfectly well

>came to do that, and I hope it succeds!

Serial ports and parallell ports can be made faster, I have myself thought of
buying a new serial/parallel interface, permitting speeds up to 460 kbps.

I would have to disagree with that. I just purchased a new Compaq PII450MMX as a replacement mailbox for our outdated Macs at work. My first experience with using old hardware on this machine was pretty dismal. I backed up a couple of hundered megs of data onto a couple of EZ135 carts (SCSI) using an Adaptec ISA SCSI controller and an old 386. Easy enough I thougt. Slap the ISA card into the P2 and in no time have the data on the new 12gig IDE drive. Right.... An Atari 800 could transfer the data by floppy faster. Estimated time to copy one disk over was about six hours. I never let it finish. Hey, the hardware isn't that old, and worked pretty damn good on machines like a DX2 or P90. I guess the problem lays in the "old way" of doing thing as far as disk format goes.

Hey, I don't want to screw around with the "fix to this problem crap". I just ordered an Ultra SCSI PCI card. Just for a simple file transfer. Hurray for progress and Windoez 98.

And USB will suck in the future as well as now.
It's not the change I fear. It's what they will make me pay for it.

Mike

If by older he means an 030 or 040, I think he will be very unhappy
with his purchase (or gift). Older Mac software and O/S 7.5 work
decent on a 40Mhz 040, but try running Bryce 2, PowerGoo or Premiere
4.X on the same machine. He will loose interest as fast as people
```

loose interest in what you have to say here.
It's spelled sl(O(10^36)w.

Besides, if he leaves his head in his ass and then opens his eyes,
he'll see Peter making his way out for a post.

This seems like a driver problem not a hardware problem.

You are going to order a SCSI card instead of waiting six hours for a transfer? That doesn't seem very efficient.

You would think that, except the Adaptec logs the removable without
drivers. It uses firmware....... I think that is where the slowdown
is. Win 98 or the PII doesn't handle it properly for whatever reason.

I <might> want to use the SCSI bus again.. If Win 98 doesn't properly
support the firmware, there is not much other choice. Besides, it's
not my money, and i'll have an Ultra SCSI interface.

Tru www.emulators.com There's Janus, Gemulator, StonX for serious stuff as
well as Pacifist which is excellent for games. You'll either need some ROM
images or a disk based alternative operating system, like MagiC, to be able
to use them though.If all you need is play ST games, why not pick up an old
1040 STE for around $30-60 or so....

I believe ALL of the rights that Atari had to these operating systems have been sold to www.milan-computer.de
If you see GEM (the GUI) as part of TOS, it's an early version of GEM by Digital Research (in turn bought by Novell, and I believe the PC OS division again by Caldera (Open DOS, new DR-DOS - see www.caldera.com) originally developed for an Intel-based PC architecture for use with a largely MS-DOS or CP/M compatible disk operating system (GEMDOS on Atari).

The latest version of the revamped, reprogrammed and really total new operating system TOS in development is rumoured to be TOS 5, and they are accepting suggestions for TOS 6 (which supposedly integrates MultiTOS/MiNT with single-tasking TOS in ROM).

That's all I know... :_)

No no no. Before the takeover from JTS's "Atari Division" by Hasbro, Milan-Computer bought all the rights to the operating system side of things for STE's and such. This means development for this platform is safe for now (besides, you could always opt for MagiC).

Hasbro is a real problem though. Battlesphere for Jaguar is finished for released but they cannot release it on Cart now because Hasbro seems to have lost the encryption key!!! (Seems to me all they're interested in is brand name...)

How could it be a problem with the PII? The PII is just a microprocessor. And,
if the problem lies with Win 98 (which it probably does), then this problem
does not relate well to our discussion.

You didn't mention that you needed to use the card more than once in your
original post. You said that you wanted to do "a simple file transfer." Not,
it seems, you may want to use the SCSI card again. So, unlike the implication
in your first post, you do want a better card and you don't care about the
money.

He stated that he wanted to do "a simple file transfer." Only later did he say that he might want to use the SCSI card again.

Exactly. I understand an "old" Mac is one with a 030 or 040 inside
(there really were Macs before G3, ever heard of them, Peter?). Running

system 7 or above in a MacII, for example, isn't fun anymore, whereas system 6 in the same machine is a joy. All the possible programs were available for this combination at their time, and were (and still are) a good example of what computing should be. Just how well do the present day programs run in a MacII/System 6 combination? Mac+/System 5? Like watching the paint dry? Besides, the CD's do not fit in the small hole in front of a Mac+ unless you cut some parts off with scissors, which in turn results in loss of data in the end of the disc :-)

Regards to Minnesota. No hurry back.

I'm not sure about this. The agreement between Hasbro and JTS mentioned all Atari's products, including ST and Falcon stuff.

It is true that Milan have bought something from JTS before the merger, but AFAIK it was only a license to allow further development of TOS. Technically, the rights still belong to Hasbro, so they would be free to licence it to someone else.

Neither Hasbro, JTS or Milan have given full details of what they have or haven't got, so it's difficult to be sure.

Yes, and that is why Atari always refused to release TOS rights, because some parts of TOS didn't belong to them.

> The latest version of the revamped, reprogrammed and really total new
> operating system TOS in development is rumoured to be TOS 5, and they are

Actually, the Milan is shipped with a version called TOS 4.5, which is in ROM and monotasking, and Milan MultiOS (not Multi_T_OS), which is basically MiNT with modified versions of N.AES and Thing.

They are accepting suggestions for TOS 5.0 at the moment.

Check out their web site at http://www.milan-computer.de

Cheers,
Nick

If you don't plan to cut the cost of the "legacy ports" as you call
them, then how does adding an extra port make things cheaper ?

Beleive me, the plan is to have USB replace parallel and serial ports.

>

> Even two year old memory could cripple you new system's performance. You can

Next year you won't. Besides, there is no improvement in PCI cards
compared to ISA as far as sound cards are concerned. sound data is not
as bandwidth consuming as video.

> cards (which cost under $100) but there is nothing stoping you from using

That's what they said for keyboard connectors and SIMM sockets. Hehe!
Wait until next year.

Cheers,
Nick

Hi Brian...

Hmm...I'm trying to figure out where it says that "a simple file transfer"
also mean "1 time only". Only very rarely have I ever performed any kind
of computing task that I didn't do it again sooner or later. (and some
times, *many* times!) <grin>

Catch ya later... ;-)

Thanks to Rich Davey, The Atari ST QuickFAQ is now available at the
following address:

http://quickfaq.atari.org

Much easier to remember and to communicate.

Because this a rerouting subdomain, some (old) versions of CAB.OVL will
not cope with it. The old address is still valid:

http://www.mygale.org/~bales/quickfaq.htm

Cheers,
Nick

I'm sure that you are right. In a few years, most PCs will probably not have
parallel or serial ports. But that will probably be years down the road. I

remind you of the history of 5.25 and 3.5 floppies.

> Next year you won't. Besides, there is no improvement in PCI cards
> compared to ISA as far as sound cards are concerned. sound data is not

Good sound cards do require a fair bit of bandwidth. My sound card, for example, can mix 8 channels, do HRTF for those channels, play MIDI and record simultaneously. Just mixing the channels can cost 843K/s.

> That's what they said for keyboard connectors and SIMM sockets. Hehe!
> Wait until next year.

SIMM chips were removed because they are useless on a fast machine. They provide half the performance of DIMMs and require greater control logic from the motherboard. Do you really want to use SIPs an your PII-450? And keyboard connectors didn't change overnight.

Wouldn't the correct grammer be "...simple file transfers" if you expect to do
it more than once? I thought that, since you used a singular, you just wanted
to move your data over to your new machine.

Markku Ilmanen (markku.ilmanen@nospam.ttaol.fi) wrote:

: MS makes decent software, not excellent. The thing that bothers me is
: that MS employs hundreds(?) of people to write their programs, but they
: are still buggy and delayed by months, not to talk about the size they
: take. On the Atari side, look at Calamus, Papyrus etc. A handful of
: people have produced these in a very short time, they have all the
: features you need and still take only a Meg or two from your HD. How
: come? When you run a monopoly, nobody claims. Or if they do, so what.
: "You have to use our products. There are no other. Repeat after me a
: thousand times: There are no other." Look at Apple's 1984 commercial. Is
: it too late for something similar?

The problem is not necessarily the monopoly issue (but I do agree with you
on the marketing issue). There is no true alternative to MS Office in the
windows 95/98 market by other big software companies, that run more stable
or take less memory. Did you try the other office, word processor
packages, like Corel Office and the Wordperfect 8? No real advantage to MS
Word.

IMO the difference in quality is due to the diiferent programming approach. In a big company, there are employees working on the software, coming in at 8, leaving at five, leaving the company, entering the company. I guess that not only there are more programmers working on the apps, but also that the programmers always change and new programmers need to get through the sources the employees before them have done. On the Atari the programmer can be almost identified with his programm. But then again, what happens if that programmer dies?

Another point is that in the PC market there is a sickness called "feature virus", that forces the companies to release software as quickly as possible and with as many features as possible- just because of the way the magazines test and compare software (by checklists).

: > played around with, it's a shame the rest of the US and world for that
: > matter, didn't realize this.

In Europe it was quite successful, especially in Germany. But it is the US market that counts.

Alfred

Hey Brian...

I would never read a statement that says "...simple file transfer" to mean that it would only be performed once, and never again. Thats quite a bit of a stretch, for an assumption. In fact, in a later message he actually said that he would probably do it again (might). ;-)

PS This is just semantics though, and I am
bored, so lets talk about something else! ;-)

Then read more carefully :-) I did mention daisy-chaining, albeit as an example of what the old 8-bit Atari home computers had... they could daisy-chain too you know. The question is: do we want this, and why. What are the possible consequences of it? I prefer a hub or switch to daisy-chains almost anytime (except maybe when there's not much space or you want to avoid to many different cables). What if you break the chain or the chain gets broken? How well will the other devices react to that? Until I see some USB in practice I'm not willing to bet on it just yet. It has to be field tested by regular users.

This is all, ofcourse, IMHO.

<<snip>>
>
> No? What would you use? Existing serial ports go no further than
115k.

This is completely untrue. Only ports based on the 16650 or 16550 UART stop
at 115.200 bps.
These are the interfaces that usually get to be used in bog standard PC's,
not high-end
systems.

I can order indusrty-strength standard serial ports of 230.400 or even
4Mbit/second for my clients
any time a day. They all have in common that they work in bog-standard ISA
too.

So are these an awful lot more expensive? No they're not. Why not use them
(and they ARE standardized).?
Because the more stupid you can keep people, the less questions they ask and
the more selling
points you'll have for your "new" stuff. I've heard that an old 8-bit PBI of
the old 8-bit Ataris could do
115k2 as well.... (but I know not enough of it to confirm this).
<<snip>>
>> You have an interesting idea of 'all over the place'.
>>
>
> No, you do. When USB printers are widely available in _BRAZIL_
>(where I live), it probably means it's REALLY all over the place, and mind
>you, just saw an ad for those new EPSON USB printers on the paper today.

Epson Stylus printers offer both parallel and MAC-compatible
RS-422/423/AppleTalk
compatible serial connections as standard. Why use dedicated USB if they
already support
both parallel and serial as standard? In addition, you can get extra
buffered parallel ports
for the Epsons, as well as networking cards (Ethernet 10Mbit, TokenRing
16Mbit, etc.)
and other serial interfaces. And don't forget IR-ports. These are available
in a 4Mbit/s
standard, if I remember correctly. So it would not be so hard, should USB
really be a
markete success, to retrofit any and all existing hardware with USB...
>
> No, not true. PC joysticks won't work on your ST, and vice-versa.
>Same for mice. Isn't it a pain having to track down ST mice, just because

I remember that I saw an ad for a serial port mousedriver ina German mag
once. So you can
use serial devices on an ST.

>it's some stupid proprietary format? How about the stupid monitor
>connector too? I wish people knew what "standard" means back in the 80s.
Well, as a matter of fact, altough very rare, the Atari pin-outs do conform
to the
DIN standard (DIN = Deutsche IndustrieNorm) that has been popular throughout
Europe.
Standard MIDI = 5 pin DIN. Standard keyboard = 5 pin DIN. PS/2 connectors =
mini-DIN.
For a long time (long before RCA jacks), 5-pin DIN connectors were even used
for speakers
and other stuff. The funny 15-pin? PC-joystick connectors are only standard
on PC's. But then
again, PC's are the standard of today.

But the Atari-joystick pinouts were widely accepted for years by all rival
brands and competitors
as standard. From MSX, to Amiga (see specs of Amiga Lorraine project on
www.atari.nu) to
8-bit, 16-bit and 32-bit systems of Atari and other vendors, they all
conformed to that standard.
This meant that you could usually easily connect joysticks for one system to
an otherwise completely incompatible
system, altough the pinouts may have been interpreted differently or, more
precisely the signals coming
from it. This is why on MSX systems some "arcade turbo" type joysticks have
to seperately programmable
fire buttons (just like Atari 7800), whereas on say ST's, both buttons did
the same thing (one signal).

<<snip>>
>>   USB doesn't adequately address those limits and
>>   imposes some of it's own. Furthermore, those
>>   limits are being actively misrepresented.
>
>
>   What? You mean USB is not adequate for serial connections, like,
>modems? How so?
He didn't say that did he, "not adeqyate for serial connections". USB is a
serial standard, so ofcourse it is
DESIGNED for serial connections. That does not necessarily mean that it is
also the right standard for other
types of connections.

As for an explanation of "misrepresented": you yourself stated that current
serial connections or ports are limited to 115k2. Perhaps the most commonly
used, yes, but faster ports, including 230k4 and 4Mbit as well as multi-port
breadboards are readily available - if you know where to look. I have a
US-Robotics I-modem. Its standard 25-pin serial port can cope with 230k4,

provided that the terminal or computer you use it with provides its signals at such a rate (see first few lines of my reply). How do you think servers with multiple TA's and modems connected to them operate? Do you think there is a maximum of four serial connectors because usually, in case of PC's, only COM1 through COM4, or if you 're lucky, 1 through 8 are supported by the BIOS of your machine?? This is totally misunderstood. There are many comms solutions available for this ranging from 30 extra ports to over a thousand, using simple RJ-11 phone wiring or other standardized methods.

> Tell me some of those limits then... I can't seem to remember any...

I thought you'd read the whole thread? Including mine? There are limits to hubs and daisy-chaining, USB too has a speed limit, etc, etc. The rest someone else will probably post here.

Keep the discussion alive :-))

>No, not true. PC joysticks won't work on your ST, and vice-versa.

There have been some adapters for PC's that enable you to use standardized digital 9-pin Atari joysticks. Also, remember Ataris own PC's?
They used Atari mice, just with different driver software. Saved you an

extra
COM port.

>Same for mice. Isn't it a pain having to track down ST mice, just because

See other reply.
>it's some stupid proprietary format? How about the stupid monitor
>connector too? I wish people knew what "standard" means back in the 80s.
It's not impossible to modify and hook-up a VGA monitor. I've seen many
people with VGA
VDU's hooked up their ST's WITHOUT having any special video cards, just an
interface
adapter...

This is far more true for the PC world. CGA TTL-level pinouts, EGA pinouts,
proprietary VDU pin-outs, ECL, and then there was VGA. At first just like
EGA which
got people confused because they used the same connectors but one was
digital,
the other analog, which resulted in many a damaged or destroyed VDU or
graphics card...
Not to mention composite stuff...

I think that in those days, one proprietary standard for Atari systems or
for Macs (which it still
is I believe, or do they use standard RGB-seperated BNC??) or for Amigas
made things
easier for those people. Ofcourse, VDU manufacturers didn't make much of a
problem of it.
Philips made quite a few VDU's that could be connected through composite
video. analog RGB,
digital TTL, etcetera... Even "proprietary / OEM" versions of existing
monitors for various brands.

Not to mention ECP. One uses synchronous data transfer, the other asynchronous and direct memory access (in a good system) in stead of a polling or interrupt mechanism.

>example, can mix 8 channels, do HRTF for those channels, play MIDI and
record

>simultaneously. Just mixing the channels can cost 843K/s.
All of which a $700 standard Atari Falcon does as well. Okay so it costs
843kB /second.
Standard ISA has a 16-bit bus bandwidth with a 8MHz clock frequency -
sometimes higher,
like 10MHz ("enhanced" option in BIOS). 16 bits = 2 x 8 bits = 2 bytes.
8MHz = 8,000,000 / second. 2 bytes x 8,000,000 = 16 megabytes / second (in
theory, right?).
Take some bandwidth off becayse of other devices still connected to the ISA
bus (do not count video card,
since these are nowadays connected to PCI or even AGP) like low-speed serial
ports and
such (if they're not in an IC or PLC on your mainboard already).

Do you still think ISA couldn't cope with 843 x 1024 bytes per second if it
can cope with 16,777,216??
Okay so let's divide it by two to account for any other possible limits in
the system or chipset or
lost traffic along the way - it doesn't matter - try accounting for every
possible flaw.

You're still left with 8Mbytes/sec performance. Even if you say that ISA
causes more CPU overhead,
you're still left with plenty of badnwidth. If you experience any problems,
chances are you'll get more luck
if you look into the combined performance of your SCSI controller and disk.
Right combo?
Don't use IDE for it as this causes again extra overhead on your CPU (which
you can compensate for
using a soundcard with a dedicated memory and/or a dedicated processor to
process the datastream and
also makes your soundcard one hell of a lot more expansive). Phew - am I
glad I use a Falcon...

>SIMM chips were removed because they are useless on a fast machine. They
>provide half the performance of DIMMs and require greater control logic
from
>the motherboard. Do you really want to use SIPs an your PII-450? And
keyboard
>connectors didn't change overnight.

Won't argue with that, DIMM replaced SIMM not only because of performance,
but moreso to overcome
the problem that Pentium PC's usually require SIMMs in PAIRS. A DIMM already
consists of TWO (DUAL).
Hmm - a collegue also noted that DIMM has a full 32-bits wide bus to the
system, and SIMMs have a 16-bit
(or so) bus.

Keep it up :-)

Forgot something: how about 8-bit Token Ring cards (16Mbit/sec) in PC's? Take a hell of a lot more bandwidth than your 843K. So PCI a necessity for soundcards? Perhaps they make things easier for everyone, but that's about it.

The prime value of a PCI soundcard would be more
sensible autodetection. PCI is quite nice when
compared to ISA 'attempts' at PnP. It also allows
you to not have to strictly partition your slots.

I'd love an all PCI system with as many slots as
my old VL system had.

Are you sure that it's not 32-bits for SIMMs and 64-bit for DIMMs?

SIMMs (72pin) are 16 bit and DIMMs are 32 bits.

Its been a hectic two weeks which kept me from posting as often. See what happens, the activity in comp.sys.atari.advocacy about dies off..

If any of you jihads are in the Bloomington MN area on Wednesday morning(will do coffee and pie at the Perkins cafe), I can be found at the CompUSA with my predecessor doing tours and will end up at Rooseville Comp in the afternoon.

Best Regards,

Peter S.

    hmm - I guess  you then haven't seen  the literally DOZENS of  posts
we've been having - and intelligent  ones, too, with some new guys  (Q5)
who've hopped on  board. In fact,  a welcome change  from your  standard
press-release, Steve-Jobs-butt-kissing parrot droppings.

    Of course, if you had a REAL newsreader (or had at least half the
IQ of a fruit fly to install one), rather than the pathetic search on
DejaNews, you'd know what we'd have been talking about. :)

    What Jihads? The only Jihads around here are the ones in your
paranoid little mind. You little MacDavidian you..... :)

    I think you'll be training a new protege once the posse from Texas
gets the extradition order through.....

Of course, only a few sad people enjoy picking on the users of smaller platforms.

Tell me who's the jihad here. You have apparent suicidial tendencies.

At least the average level of intelligence per post has risen considerably during your absence.

Why do they need so many pins? SIMMs having 32 bits made sense to be cause you
could have power + ground + 32 data + 32 address + 6 control. What do they do
with all of the pins?

Agenda for Toronto Atari Federation meeting, October 21st 1998:

there's a very popular operating system out there - and Atarians can use it!

On October 21st, TAF will be hosting a night to discuss about LINUX, the UNIX-like operating system that's been growing very popular with the PC crowd, and has recently made the news what with Intel recently investing in a company that distributes it. And remarkably, we can even install versions of this on TTs, Falcons, Hades, DirecTs, etc.

We will have on hand a speaker from the Canadian LINUX club CLUE who will discuss with us the history and advantages of using this pre-emptive multitasking system, the software that's used with it, etc. And hopefully we'll also have it installed on one of our computers as well for a hands-on demonstartion, as well as other Atarians who use or program software for LINUX.

This should be a most interesting night! See you there!

PS - November 18th is the next TAF MonSTEr Flea Market! Circle your calendars now.....

TORONTO ATARI FEDERATION User Group meetings are held on the Third Wednesday of the Month in the North York Memorial Community Hall on the Lower (or Concourse) Level of the North York City Centre Library at 5110 Yonge St. at Parkhome Ave. Parking garage inside the complex. Those using public transport can take the TTC's Yonge-University-Spadina line to North York Centre Station. Meetings start 7:30 PM, $2.00 to non-members. Membership is $35 CDN a year, and includes a subscription to the club newsletter PHOENIX and full use of the TAF Online BBS. A membership in TAF IS Atari support!

    nope. Very little Atari people have to use DejaNews (and those who
do usually set up NEWsie). Your insistence of using DejaNews despite
your constantly bragging about "superior" Mac Internet clients show
it's YOU who has the IQ problem. No such thing as an Atari Jihad, only in
your feverish paranoid mind....

Why are the TOS cloners not promoting their offerings and getting the word out
considering that Jihads claim that its a superior product.

I wonder what claims will be made now to counter OS 8.5 with Sherlock?

I wonder why Apple does not promote their offerings, despite the claim of the
jihad that it is the superior product.

>I wonder what claims will be made now to counter OS 8.5 with Sherlock?

Is Sherlock yet another of those silly codenames Apple use for their "OSes"?
Allegra, Concerto, Gestapo, Panthera, Tomato...
Besides, what does OS 8.5 have to offer? Certainly not PMT, that's for sure.
I've been using it on my father's G3 Powerbook. Not very impressive once you
scratch the pretty surface. I still have to wait for the machine to complete
mundane tasks.

Agenda for Toronto Atari Federation meeting, October 21st 1998:

there's a very popular operating system out there - and Atarians can use it!

On October 21st, TAF will be hosting a night to discuss about LINUX, the UNIX-like operating system that's been growing very popular with the PC crowd, and has recently made the news what with Intel recently investing in a company that distributes it. And remarkably, we can even install versions of this on TTs, Falcons, Hades, DirecTs, etc.

We will have on hand a speaker from the Canadian LINUX club CLUE who will discuss with us the history and advantages of using this pre-emptive multitasking system, the software that's used with it, etc. And hopefully we'll also have it installed on one of our computers as well for a hands-on demonstration, as well as other Atarians who use or program software for LINUX.

This should be a most interesting night! See you there!

PS - November 18th is the next TAF MonSTEr Flea Market! Circle your calendars now.....

TORONTO ATARI FEDERATION User Group meetings are held on the Third Wednesday of the Month in the North York Memorial Community Hall on the Lower (or Concourse) Level of the North York City Centre Library at 5110 Yonge St. at Parkhome Ave. Parking garage inside the complex. Those using public transport can take the TTC's Yonge-University-Spadina line to North York Centre Station. Meetings start 7:30 PM, $2.00 to non-members. Membership is $35 CDN a year, and includes a subscription to the club newsletter PHOENIX and full use of the TAF Online BBS. A membership in TAF IS Atari support!

I.C. Well, ehm... a PC keyboard is hotswappable if you don't have the PS/2
(although some are) variety ;-)

Just kidding. Yes you're right, I saw the wrong point. But also, I didn't
get the whole thread (I tried) so I kind of rolled in on this).
USB also allows daisy-chaining and some sort of hubs, doesn't it?

:-) Thanks though.

I am in complete agreement with this post. Dedicated connectors also work just fine and can be made (and often are!) hotswappable. In addition, it reduces possible fault locations because it often can only be plugged into something one way or another. USB is more flexible yes, but do I need it? Not right now, perhaps in the future.

Exactly my point as well. Well, erm USB connectors alone take less space than most conventional ones, but that's about all I can think of. But I really don't care. It just creates another problem for Wintel machines. Or another sales-argumement. Or more work for system and network administrators. More problems? Who knows...

Atari, Amiga or Mac?...
Hmmm.....do any of those comps give you a "Bluescreen" with monotonous regularity?...cost you an arm and a leg every 12 months to follow the Wintel prescribed "upgrade path" and suffer from over 10,000 "undocumented features" ?...oh, and serve as cash cows specifically designed to line the pockets of the Devil incarnate ?..."no" I hear you say ?...
Then go for it!...:-)

>interfaces work perfectly well already.

So? What does one do when one is confronted with a 3rd
USB device? You buy what resembles a $100 4 port kludge
box. So the obvious question is: why not just make a kludge
box that already works with the old peripherals which just
happen to be as PnP as USB has demonstrated itself to be
anyways.

```

Something was missing: a cheap, hot connecting, PnP interface standard.

> At least they're available. Also, it's rather difficult to
> say whether that cost has any real bearing on the realities
> of cost.

Most new standards take a while to catch on unless they are very compelling. I, like most people with a fairly new PC, have a USB port on my computer. I am willing to wager that it contributed almost nothing to the cost of my PC. USB controllers are simple and shipping in large volumes. I would expect them to be cheap.

What type of network are you refering too? Ethernet? Are you sure that a mal-configured station can wreak havok with USB?

> The question remains: just what was broken & why the pressing
> need to replace interfaces and devices that work perfectly well
> as is.

On the PC side, joysticks are normally attached to your sound card. Many sound cards only have one port so, if you have more than one joystick, you have to swap them (also, you need drivers for your sound cards gameport). Very annoying. On the PC, you can only normally have one keyboard attached to your computer at a time. This is annoying as I like to use a different keyboard for number entry and for typing and switching keyboards is a pain. Most new PCs only have a single serial port and tablets are usually connected through the serial port. So you cannot use a tablet if you need that port. Most PC printers and scanners are connected through the parallel port. But most PCs only have one parallet port so you either have to buy a SCSI card for your scanner or swap your printer and scanner all the time. Also, on the PC, none of these devices are PnP.

On the Mac side, things are a bit better. ADB allows you to chain up to 15 devices together. But USB is likely to have more and cheaper peripherals, it is hot connectable, faster and supports more devices.

So, I'll have to disagree with your statement that these devices and interfaces work perfectly well already.

Well, do you use Wincrash related stuff or an Atari? ;-)

Gravis has still readiliy available an adapter for any sound card that gives you two analog joystick ports and a genuine 5-pin DIN MIDI IN, OUT and THRU port on your soundard without additional drivers (or so says the manual).
2nd joystick port uses a different address, usually.
>Very annoying. On the PC, you can only normally have one keyboard >attached to your computer at a time. This is annoying as I like to use >a different keyboard for number entry and for typing and switching >keyboards is a pain.

Also, on the PC, none of these devices are PnP.

Seems to me like a PC problem, not an Atari problem. Well, perhaps we should buy computers that are not a PC, like... wait a minute.. this is comp.sys.ATARI.advocacy, right? :-))

>On the Mac side, things are a bit better. ADB allows you to chain up to 15 devices together. But USB is likely to have more and cheaper peripherals, it is hot connectable, faster and supports more devices.

Hmm this all sounds kind of like the old Atari 8-bit computer daisy-chain serial ports of the 400, 800, XL/XE, etc....
That was universal to, albeit limited to Atari...

>So, I'll have to disagree with your statement that these devices and
>interfaces work perfectly well already.
Do your Atari joystick ports work?
Does your keyboard connector work? (You shouldn't take a PS/2 one)
Does your PS/2 mouse or mouse adapter work?
A PC can havemultiple serial ports. A TT has four.
Does SCSI work for scanners? For printers? For hard drives? Ah yes... Ultra Wide SCSI huh? That also means 16 daisy-chained devices, doesn't it? Perhaps even more...
Does your parallel port work? Can you use a printer on it? Can you use a scanner on it? Can you use a storage device on it?

```
Seems to me there's plenty of choice of working alternatives...

I have worked with computers of all sorts for quite a few years now and have yet to lay my eyes on a Jaguar, and therefore Myst on an Atari. You do know the difference between a console and a proper home computer don't you?.

And if WebTV suck so much (and it does) WTF do you use it?.
Why not use an Atari?
WebTV has zero potential, no matter what platform it is based on.

A well constructed arguement on why the Amiga sucks would have given you some credibility with your opinion, but as it stands it sounds like something an illinformed 14 year old would say.

Clockmeister.

Mine only has one and since it is used in all DVD equiped Dells, there are a lot of computers that only have one. But even with 2 ports, you can't have a joystick and two game pads. You need the joystick to play sims and the game pads to play sports games. Of course, you can buy a box that connects to the game port and provides 2 or 4 extra game ports. But then you have a piece of hardware that is just as kludgy as a USB hub and still doesn't solve the problem of having to switch drivers when you want to use a different joystick.

[BTW, you didn't address the keyboard issue]

> Not so. Various PC SCSI scanners come with the necessary SCSI
> card as part of the package and parallel scanners also have
> passthru connections for the printer.

Some do. If you buy a SCSI scanner then you are obviously paying for any bundled SCSI card. And I have seen scanners without pass-trough connections. Also, neither SCSI nor parallel connections provide PnP. SCSI is not a hot pluggable bus.

> Neither is the scanner as of yet. <chuckle>

Bugs in a pre-release version of Windows 98 don't make USB a bad interface.

> So? What does one do when one is confronted with a 3rd
> USB device? You buy what resembles a $100 4 port kludge
> box. So the obvious question is: why not just make a kludge
> box that already works with the old peripherals which just
> happen to be as PnP as USB has demonstrated itself to be
> anyways.

Here is why not:

1) Your kludge box will have to offer me 4 ports of the same type unless your kludge box can do some interesting things. What happens if I need 2 extra serial ports, a parallel port and a game port. Can I get that by buying one of your kludge boxes? If so, will you let me exchange kludge boxes when I no longer need the serial port and, instead, want an extra game port?

2) Will your kludge box automatically detect when I plug in new devices and load the appropriate drivers for me?

3) Will the operating system recognize all of my game devices, attached to your kludge box, at the same time ie. can I change from using a joystick to a gamepad without changing any configuration settings?

I another post, you called me a dickwad, and said a lot of people care about the IStapler. If you are saying it shows how stupid certain Mac users, like Peter Sinclair are, then feel free to say that. Anyhow, this is an Atari newsgroup, so what does the IStapler have to do with this newsgroup? Feel free to welcome Peter Sinclair's offsubject posts on here. I assume you enjoy your newsgroup being cluttered with his offsubject stuff.

By the way, I would highly suggest you not go casually saying someone is a moron, particularly, if you are correcting me when I used the word "maroon". I am perfectly aware of the word "moron". Apparently, you are not aware of your Warner Brother cartoons. Rather than call someone a moron, the expression is, "what a maroon". This is where I got it from.

Good day...
- Richard Hutnik

Wrong. Dead Wrong. No Amiga from the A1000 to the A4000 has standard
built-in sound that can come anywhere near the Atari Falcon 030. There
are expensive add-on, aftermarket cards that can be purchased (Sunrize,
for example) but thats it. Not Standard. Just 8-bit...

I used to use WebTV, once upon a blue moon. And, it does suck. I payed about
$300 Americano for it (including keyboard) and sold it for $75 a few months
ago. What a sucker that bought it!!

The USB port wont solve the driver problem either.
However, joystick port kludge-box or splitting cable
will work without tossing out old equipment.

     Judging by the overwhelming adoption of USB over the period it
     has been bundled with new systems, that sort of need must be
     underwhelming indeed.

>2) Will your kludge box automatically detect when I plug in new devices and
>load the appropriate drivers for me?

     Will your OS do so without a BSOD or other similar PnP
     artifacts that have already been experienced?

>
>3) Will the operating system recognize all of my game devices, attached to
>your kludge box, at the same time ie. can I change from using a joystick to a
>gamepad without changing any configuration settings?

     That's certainly issue from a pure management and algorithmic
     standpoint even if your OS is doing all of it's prerequisites
     correctly. It rather sounds like the perfect instance for
     reality to come up with variations the developer never thought
     of.

     I've had good reason to distrust universal automagic PnP
     schemes so promises of yet another one that just may work
     as well as the last one don't impress me.

     As a supplement for those 'power users' it has some merit.
     As a basket to put all of one's eggs into, it does not.

     Personally, I like that my keyboard and mouse and external
     bus each have their own IRQ.

Why does everyone hate intel and microsoft?
Intel makes good equipment and windows makes decent software. Do people hate them because windows sucks? Or because they're just jealous of their success? This has always baffled me. Personally I don't like windows much. I'm getting a mac soon(an older one) so I'm curious what it's like. I grew up on ataris. I used atari 520st extensively as a kid and loved it. I think it's simplicity had a very unique elegance to it that has never been

beaten or imitated. It was more "fun" to use than anything else I have played around with, it's a shame the rest of the US and world for that matter, didn't realize this.

Yes, it will. The USB devices can be uniquely identified and their signals forwarded to the appropriate driver. The game port does not have enough information to do this. Also, I am not advocating that everyone replace their existing devices. I think that people should consider buying USB devices when they buy new devices.

> >Some do. If you buy a SCSI scanner then you are obviously paying for any

At work we have an Epson scanner. We bought it in '96. I'm not sure of the model but it doesn't have a pass-through connector.

> >Also, neither SCSI nor parallel connections provide PnP. SCSI is not a hot

Actually, I develop SV software for NT. I run Windows 98 at home. Say I attach a new printer to my parallel port. Will the drivers for that device be automatically loaded? No, the won't. So why do you think that parallel devices are PnP?

> >Bugs in a pre-release version of Windows 98 don't make USB a bad interface.
>

> It doesn't demonstrate the value of it over other

You were using a bug in a pre-release version of Windows 98 to desparage USB. A buggy operating system doesn't make an interface standard flawed. If Windows crashed after you installed a SCSI card, would SCSI be flawed?

> Judging by the overwhelming adoption of USB over the period it
> has been bundled with new systems, that sort of need must be
> underwhelming indeed.

As I said before, new standards do take a while to catch on. Even the CD-ROM had a slow initial adoption rate.

> Will your OS do so without a BSOD or other similar PnP
> artifacts that have already been experienced?

Irrelevant unless the flaw lies with the interface and not with the operating system.

> >3) Will the operating system recognize all of my game devices, attached to

When the OS receives a signal from the game port, it doesn't have any idea what kind of device is sending the signal and, therefore, can't automatically determine which driver to use to process the signal. So the user has to tell that operating system what type of device is sending the signal. On Windows 95/98, you use the "Game Controllers" control panel. With USB, however, the operating system knows exactly what device is sending the signal and can forward the signal to the correct driver without user intervention. That saves you the hassle of going to a control panel every time you change devices.

Considering what can be done with current joysticks, that's
dubious assertion.

All the device needs to do is to be able to communicate with
the OS. Even something as old as an HP540C can do that with even
the first release of Win95 quite nicely. It merely the same
level of organization and discipline required for IP port and
PCI ID assignments.

Win98 should have been gold at that point. It was very
likely a release version. Furthermore, it was a staged
PR event. So one should expect the conditions of the test
to be rather ideal. This was not some early QA iteration.

Both are an issue. The concept is as much of an issue as
the implementation is. Abstract design concepts very much
impact real world performance.

     ...sounds more like your problem is in windows, actually.
     Either way, it seems that you will still have to manually
     tell the OS something.

--
Hardly. Microsoft has brought the microcomputer OS to
the point where it is more bloated than even OSes from          |||
what was previously larger classes of machines altogether.     / | \
This is perhaps Bill's single greatest accomplishment.

> An A500 has the same expandability as a 520ST.

Having owned both, I can say with conviction the A500 was much easier to
expand than the 520ST, primarily due to that expansion bus on the A500's
left side.

sigh here we go again. come 2 think of it.. anyone ever hear anything 'bout
CD32 or CDTV? hmmm nah let's forget.. mustn't be that important then... ;-)

>Why not use an Atari?
>WebTV has zero potential, no matter what platform it is based on.

Hmm WebTV is actually based on many platforms. Yes it's there on Amiga, it's there on CD-i in the Netherlands the KPN Telecom company now wants to do it on pretty contemptible format and eh.. let's see there was CDTV. At least you could expand it like a decent computer...

WebTV is for someone who's bored with standard consoles and wants a little bit more but doesn't really have the guts to go out into either the real world or true cyberspace, IMHO.

>Clockmeister.

>Sense alone won't buy Microsoft, you need money... and a shitload of it!

Hmmm what do we need?
ALL ATARI + COMMODORE + AMIGA + APPLE + ACORN fans in the world, each spending $1 (er wait a minute - that's not enough)

-A common average user entry-level OS that is powerful enough for
power-users and easy, stupid, stolen or crashy enough for those people who
normally buy PC's so we can get them on our side
-Many many clones and 68K competitors still conforming to that one modular,
multithreading, multi-user, multi- & parallel processing OS with built-in
connectivity features for a host of networking apps both remote and local
-Win16 & Win32 emulation, Linux emulation, DOS emulation, OS/2 emulation,
Mac emulation, MagiC emulation, Kickstart/Workbench emulation MSX emulation,
.... (well not completely emulation, sort of native being a modular
operating system)
-Common reference to cheap peripherals
-Powerful marketing name & marketeers
errr
did I forget anything?

piece of cake :)

I think the only real enhancement of Falcon-competitors (about equally old) was the AGA. But I'm not qualified to vouch for that. Perhaps Clocky(tm) can give us some clues??

F030 did 8-channel stereo sound at 50kHz well - STE's did 50, Falcons did about 49 - at 16 bit. Now there's aftermarket hardware for the Ataris that had a VME bus and for current clones to match f030's performance or bneat it (24-bit) - card's name doesn't spring to mind yet, have to look it up...

Hmm

There are some controllers that are connectable to a stanard serial port (not just mice)

Of course had you had an Atari falcon or ste you'd have two standard ports, 2 extra ports (expandable to 4) totalling 6 ports then there's the parallel port adapter for even 2 more ports (just like amiga - same adapter i believe) which makes 8, and using paddle in stead of joysticks makes 16. hmm on a jaguar you could daisy-chain'em with the right soft- and hardware wchich would make even more. and even on ataris you can - with the appropriate drivers - attach some devices to the four or so serial ports on a tt.... (tt also has the two expandable ports of the falcon and the ste / mste)

Hmmm or you could use USB?

A Gravis MIDI-adaptor also solves your problem if your joyst8ick port can
have multiple addresses assigned....
gives you three genuine midi ports as well, just by connecting the box :-)
to bad they don't make sound cards anymore :(

Consider a RAID5 controller. They can be hotswappable you know. Yes I know
this is not the same as hotpluggable. But isn't this an issue for a
different newsgroup, like a techie one?

Maybe I'm just tooooo plain basic :-))

Actually, it's a true assertion that can be easily tested. Buy a game port expander and plug a Flightstick and a Gravis Game Pad into it. Without using the "Game Controllers" control panel (or doing it directly in the game if it does direct controller management), neither device will work. And when you switch devices, you much change your settings. With USB, you don't have to do this because the operating system knows what device is sending the signal.

Doesn't the phrase "Plug and Play" imply that you can use the device as soon as it is plugged in? This is not true of parallel devices because you still have to manually load the drivers. With USB, the drivers are automatically loaded.

> Win98 should have been gold at that point. It was very

But even if the release version of Windows 98 has this bug, it wouldn't make USB a flawed interface standard. Just as flawed SCSI handling in Windows 98 wouldn't make SCSI a flawed interface standard.

> Both are an issue. The concept is as much of an issue as

Can you describe some specific aspect of the design that might make for flawed real world performance?

> ...sounds more like your problem is in windows, actually.
> Either way, it seems that you will still have to manually
> tell the OS something.

OK, explain to me how, in any operating system, you could tell what device is sending you signals over the game port? You could not tell unless these signals happened to be unique for each device (which would be a huge fluke) and you had some huge amount of code that could analyse these signals and figure out which device was sending them. USB, OTOH, provices globally unique device identification (like Ethernet cards do) so the operating system can tell what device is sending what signal. It can then forward that information to the appropriate driver for processing. So, you do not have to "manually tell the OS something" with USB.

     There's also expense and complexity to consider. While
     we may find the entry price to the net with a general
     purpose microcomputer acceptable, many do not. A sub
     $500 solution that doesn't require a special purpose
     (vga/xga) monitor that adds even more cost  is just not
     that easy to come by these days.

     A TV can be a useful price tradeoff for the time being
     for those who find that a monitor that you can buy for the
     price of a 19" TV to be somewhat unimpressive and an 18"
     (actual measure) or larger computer monitor to be an un-
     acceptable extra expense.

RAID racks are an entirely different beast altogther. However they do provide a useful proof of concept. Many of the sorts of things one could do to create a nifty new connector can be applied to existing tech with less impact. There's no reason that the 'PnP' joystick with a USB connector couldn't accomplish the same thing with an older physical port.

It may be interesting to note that many of the USB scanners are just slightly modified EPP ones and still retain their EPP ports.

>
>Maybe I'm just tooooo plain basic :-))

USB is too slow.
Each port needs it's own IRQ.
The star topology is going to cause usability problems.
Something like an iMac needs multiple ports (more than just 2) to ensure sensible IO management.

     The catch with this example is that one does not
     know exactly where the problem is. The more intresting
     joysticks that require special-purpose drivers should
     be more than capapable of identifying themselves. It's
     likely all rather driver dependent.
```

Whatever method you could use over the USB wire would work
similarly over any other, especially if you're going to
have to overhaul that entire subsystems drivers anyways. The
OS can poll devices regardless of the physical configuration
of the wire and devices can similarly broadcast. Although
either of those are potential problems.

As much as we might like to judge anything by it's
ideal potential, it's the implementations we have
to live with.

Broadcast stations lowering effective thruput drastically
by unnecessarily throwing messages on the bus would be
a good one.

That's what protocols, IDs & special purpose drivers are for.
Those will layer on top of an old set of wires just as well
as they will layer on top of a new one.

Yes you do. The user still needs to tell the OS what to
do with those inputs. At this point, while the machine
has an eternity to spend processing user input it can do
a single controlled poll of the bus.

Ummm, as a Mac user you should know better. Ever hear of an ADCON SCSI
Power Plug? It allows "'hot plugging". While sold for the Mac, it even
works on an Atari.

Mike

One of your critics of USB was that you would have to buy new devices to use
it. If you changed the protocol used by game controllers then you would also
have to buy new devices because the old ones would not be able to communicate
using the new protocol. So, if you are going to replace your devices anyway,
why not use a better interface?

> Whatever method you could use over the USB wire would work

I don't know what you are talking about. I'm claiming that PC parallel devices are not PnP and USB devices are. Do you believe this to be true or false?

> As much as we might like to judge anything by it's

So, if the Windows 98 implementation of SCSI handling has flawed then you would judge SCSI to be flawed.

> Broadcast stations lowering effective thruput drastically
> by unnecessarily throwing messages on the bus would be
> a good one.

Such as? Please provide a specific example, that you know can happen on USB, which "drastically" reduces through-put. You wanted to discuss real world implementations. I would like you to give me a real world example.

> That's what protocols, IDs & special purpose drivers are for.
> Those will layer on top of an old set of wires just as well

By "user", do you mean "application" ie. user in the mainframe sense? I can changed USB joysticks in the middle of a game without adjusting anything. I cannot do that with game port joysticks.

Actually, I hadn't heard of this device. It sounds pretty cool but I bet that
it has the following limitations:

1) For generic drives, you have to manually mount the drive
2) If the drivers do device detection at startup then you are out of luck.

You've not convinced anyone but yourself that it is infact
any better. I certainly don't relish the prospect of nested
hubs or paying more than the going rate for 100BaseT for them
either.

The old joysticks conform to a common, set standard, they
should be easy enough to deal with. In fact, the new special
protocol joysticks working along the older ones rather demonstrate the feasability of this arrangement.

Odd that Windows95 has different ideas. Mind you, it likes to
autodetect my printer mulitple times but it is quite up to the
immediate task.

Yup. If it 'cant be done right' that is also a potential
design flaw. While Spruce Gooses might be a nice flight
of fancy, they really do need to get airbourne sooner or

```
     later.

     We don't have to replace all of our old devices, that's the
     point. There's no reason that an ST style USB keyboard shouldn't
     have physical connectors for Serial and Bus Devices (or joysticks).

     I'm not so trusting of my OS or application software.
     Nevermind just how is the OS supposed to automagically
     deterimine that device Q should now be used in place of
     device R's inputs on a bus?

     At least with a standard joystick port, all software
     can make decisions based on specific assigned input
     channels. USB doesn't appear to have such things and
     user input will be required for the OS to sort things
     out.

That's a driver issue, not an interface issue.

You don't know that. I think that USB is a better interface because it allows you to replace a lot of the low speed interfaces on your computer with a common standard. That way you can add devices that you need without worrying about port availability.

> I certainly don't relish the prospect of nested
> hubs or paying more than the going rate for 100BaseT for them

The price will fall over time as USB becomes more popular. CD-ROMs were expensive to begin with but now they are very cheap.

That's the problem: you think that joysticks work fine now and I don't. I don't like making a trip to a control panel every time I switch joysticks because there is no standard protocol for identifying devices.

> Odd that Windows95 has different ideas. Mind you, it likes to

Isn't printer autodetection just a guess? There is no standard way of going
it, I believe, you just send signals and see what response you get. Then you
guess what type of printer it is and ask the user to confirm. None of this
uncertainty exists with USB.

So you think that if Windows 98 doesn't do it right then it "cant be done
right"? That's absurd.

> >Such as? Please provide a specific example, that you know can happen on USB,

Nope. I asked for a USB specific example. Please provide one or concede that
you are not aware of any USB through-put problems.

>   We don't have to replace all of our old devices, that's the

But it wouldn't use your new protocol so how could you identify it?

Easy. USB devices send their device ID along with the data. That way the
operating system can easily know what device is doing the talking.

> At least with a standard joystick port, all software
> can make decisions based on specific assigned input
> channels. USB doesn't appear to have such things and
> user input will be required for the OS to sort things
> out.

Why? The operating system can get a listing of all the device on the bus and
can then use the ids of these devices to assign drivers to each device. If it
can't find the driver for the device then it can either ask the user to
install the driver software or ignore the device.

Ohboy, trivial applets, crippled office suites and
web content that will crash BOTH your browsers.

Excuse me if I'm not elated. I've experienced your
'promised land' first hand. JAVA is NOT one of the
things I would miss.

The sourcecode for Kaffe is rather available actually as
is gcc...

GUIs are more intuitive by nature. If you drag your System folder
to the trash, you know perfectly what you're doing. But, in a CLI, you
might delete things you didn't mean to, by accident. I did that many times
before, you know, rm -rf, etc...

I don't see how. The actual release of MacOS X is too far away,
but I bet that we'll see many shells available for it. And, of course, X
Server already has a couple of them ported and working fine, in addition
to the built-in one.

ah, but how long does it load under JAVA? The thinking behind
successful web pages is that it loads quickly and immediately, as long

load and format times turn potential customers off. I've gotten lots
of praise for my web pages from users of all platforms for its
no-nonsense and FAST loading - something I wouldn't have gotten with
having JAVA aboard....

more than legacy stuff, bonehead. Try Jinnee (hot new desktop), new

version of Calamus, Smurf, Papyrus 6, NVDI 5, MagiC 6, SpeedoGDOS 5.7.
The above proves once again that you're a nebbish as far as knowing
beans about Ataris....

does the term "a fool and his money are soon parted" register?

my assertion has nothing to do with what the public buys, but from
proven test results on ZDNet.....

yawn....still no USB drives, no printers, very few peripherals, and
I can't pick them up at my local Business Depot or Grand & Toy.

It makes sense that you'd post a press release, seeing as you're
nothing but a mindless Steve-Jobs-butt-kissing parrot......

    the fact that you've bragged often and on about the superior
clients for the Mac, and you still can't seem to configure NewsWatch. I
did on my Powerbook, and I'm still just an "Atari boob"....

    I think you'll also notice that many Atarians who use DejaNews go
on to ask how to get the Atari up and running on the net......

Hi all. I'm new to this news group, just been taking a look through some
of the previous posts. Wow. Talk about snippy!

I had (still do) an 1040STe that I reckon is one of the best computers
ever made. I have dreams of being able to use some of the software from

the PC and Mac on it...

Re the Java for CAB posts - I have a Mac on which I program in Java (you guys'll hate me!). I wish there was a Java port for the ST (which ran quickly!) so that I could write my progs and still use them on the 'beast'. Has anyone considered doing a Java-to-native compiler? This would strip away a fair bit of the Java overhead.

I agree with the point that Java is slow - it's pathetic on a PowerMac! You need at least a 120MHz Mac to run anything at a decent speed. However, the idea of being able to write a program and run it on a multitude of platforms with no mods is, in my opinion, brilliant. If a fast, efficient version of something like Java was available before Atari folded, who knows - maybe we'd still have an independant computer manufacturer turning out low-priced and (relatively) high-powered computers. I may be wrong, but I believe it was largely the lack of support caused by the lack of popular software (like MS Word ... ughhhh...) for the ST that caused Atari's woes. Just when they brought out computers like the Falcon....Makes you sick doesn't it?

Enough already - I love the ST, wish 'twere still around, but from the looks, there are still some people writing for it. Who knows, maybe Hasbro will relaunch it - right after 1st Porcines take off..

'Bye

a good little computer there! I had one for about three years, and probably would still have it if this good deal on my Falcon hadn't come along :) But why would you want to run PC or Mac stuff when there's quite a few programs for the ST that are pretty powerful in their own right? Feel free to e-mail me if you have any questions about what you want to do.

the whole sorry mess came down to the fact that the Tramiels were so incompetant at promotion of their stuff that they couldn't market immortality - that and that they generally treated many of the third-party people like dirt when it came to giving them the necessary info, development machines, etc. The R&D department, though, came up with some amazing stuff.

Still, it'll be interesting to see what happens now with the Milan out in Europe and coming soon to the US - this machine certainly has many people abuzz, including some developers from the past.

>Enough already - I love the ST, wish 'twere still around, but from the
>looks, there are still some people writing for it. Who knows, maybe
>Hasbro will relaunch it - right after 1st Porcines take off..

not very likely. Hasbro does respect the brand name, though, as they recognize its proud heritage. And you're right about there still being a hard-core group of people writing for this platform. Three years ago, people were saying that Atari STs weren't fast enough or had enough RAM or system resources to properly use the 'net, and it took the work of three people in three different parts of the world to prove them wrong. And we're still proving them wrong to this day :)

Updated 11 September 1998:

- NEW: The README network !
  The banners can now also be used to expose your site from
  any other sites in the network (at random).
  Details on how to join are available at :
  <URL:http://www.ping.be/amigaphil/pic/SBill.html>

- There are now 61 banners you can choose from,
  plus 5 templates to help you to build your own.

Would you like to claim your right to exist as a non-Microsoft user ?
Are you defending Internet independence and worldwide accessibility ?
Are you supporting competition ? Interoperability ? Open standards ?
Are you dying to pie Bill Gates ? Steve Ballmer ?

Here are some more cream pies (Web banners)
to calm down Microsoft's voracity !

- PNG format (GIF available on request)
- size 400*60
- 16 colors

- nice looking :-)

- Templates included

Those banners can be found on:

<URL:http://www.ping.be/amigaphil/pic/SBill.html>

Use them as you wish, and if you like to support this creamy
campaign against Microsoft's seizure on everything,
why not join the README network ?

I posted this on c.s.a.st a few days ago, but haven't received any response. Hope no one objects to reading the same message (with a clarification or two) again.

Hi,

I have access to a KIP 2900. This machine is basically a scanner and laser printer for printing blueprints. The interesting thing is that it uses rolls of paper, so effectively, the only limit to the length of a printout is the length of a roll. This system will enlarge up to 400%, with exceptionally high quality.

This enlargement factor would put a standard US Letter (8.5"x11") out at 34"x44" (2.85' x 3.66'). Consider a banner consisting of 8 sheets taped end-to-end. 34" x 352" (2.8' x 29.33') - actually a little shorter if using individual sheets instead of banner paper, due to cutting and pasting. I'll let you convert this to metric as I'm just putting forth the idea at the moment, and will put a page up with full details if there is any interest in the idea I'm about to present.

I was working with the KIP 2900 today and started thinking. Wouldn't it be an interesting project to do an Atari banner up - With a Fuji & something along the lines of foot-and-a-half high letters proclaiming "The Fuji Lives!" (or a phrase to be decided upon later) in english, and then translations into French, Spanish, Italian, German and other appropriate languages running in a smaller size underneath. It would then be covered front and back with lightweight, flexible vinyl (the iron-on type is very effective).

This banner could then be mailed to whoever was interested and willing to:

1. photograph it being displayed in their city
2. Arrange with local Atari users to sign it
3. Send the photographs back, along with a short essay about their city or involvement in the project.

The photographs would be put up on the web, for everyone to view and download. Eventually, we might even be able to put out a coffee table book describing its journey.

Hopefully, we could get some corporate/organizational/individual sponsorship in exchange for tastefully sized logos on the banner - this would be to defray the cost of postage and things of that nature.

Anyway, just a thought. Anyone have any thoughts or comments?

There is gcc for the ST, actually.

Dunno where you would find such a beast these days...

If you had a Falcon or TT you could just plain run Linux.

G'day

Thankyou for the welcome! The reason I don't use the ST much nowdays is that I need to use Java and Ada for my course at Uni, so I had to cross over to the dark side (Mac).

Thinking about it though, there is no free or convenient Ada compiler for the Mac. Now, the Ada compiler we use on the PC-contemptibles at Uni run GNAT Ada95 - the GNu Ada Translator. Could this be a case for a gcc-compatible compiler on the ST? Does such a beastie exist?

If it did this could strike a blow against the PC-owning blockheads who thinks that they invented computers! Can anyone suggest a site that would have a gcc for the ST?

I have to admit at this point that I'm not one-eyed - I also have a softish spot for the Mac. Less soft nowdays though, after Microsoft sticking their fingers into the pie...

Cheers

Just for your information, this is the latest statistics on the posts of Peter Sinclair to the different newsgroup. As you can see, Peter Sinclair's only objective is to bash Atari when he gets a chance. You can tell his timidity here, because he didn't dare post one trolling message in the PC advocacy newsgroup because they would eat his lunch, along with him (well, they would try to but probably vomit on the taste).

Get a clue Peter. You are a pathetic coward who has nothing better to do than troll this newsgroup. Get the hell off here, or at least post as many Mac advocacy messages in the Mac newsgroup, as you do on here.

For Peter's next trick, watch him troll the Colecovision newsgroup...

Linux! That's Unix, yeah? I seem to remember a magazine article a few years ago,
about Minix
running on a 1040STF being more powerful than a VAX minicomputer!

I might just have to ask on the c.s.a.programmer about gcc...

On an unrelated topic, how many ST users are there still in Western Australia? Are
there any?
Or do I have to move to America or Europe to find like minds?

The somewhat disappointing part of all this is that Mr. Sinclair is unable to pick up the not-so-subtle hint that people don't want his Pro-Mac-used-to-bash-Atari posts on here. They are out of context for this newsgroup. Why he continues is beyond me. He would, for one, get a much favorable audience if you posted just in the Mac advocacy newsgroup. He would get a far more fierce challenge, if he cared to really debate, if he posted in the PC advocacy group. My guess is that Peter is a once burnt Atari owner (heck, there are a number of them out out there. Most of them get lives and move on) and he feels to fight this pathetically needless battle of bashing a company that no longer exists under the Atari name.

As for myself, I have some emotional sentiment for the Fuji symbol, so I pop in here ever now and then. My most recent visit to this newsgroup was trigger by a bad review of the IMac, and it reminded me of Peter, and I was curious to see if he was continuing. He was...

- Richard Hutnik

Heck, if he REALLY insists on fighting Atari, he might as well bash Midway and Hasbro which own the remains of what was once Atari.

I know it's a bit late, but..

tonight TAF will be putting on a demo of MagiC 5.11 at their usual location at the Rose Room in North York Centre. If you've ever been curious about this multi-tasking operating system and what it can do to improve your Atari, see you there! Meeting starts at 7:00.

TORONTO ATARI FEDERATION User Group meetings are held on the Third Wednesday of the Month in the North York Memorial Community Hall on the

Lower (or Concourse) Level of the North York City Centre Library at 5110 Yonge St. at Parkhome Ave. Parking garage inside the complex. Those using public transport can take the TTC's Yonge-University-Spadina line to North York Centre Station. Meetings start 7:30 PM, $2.00 to non-members. Membership is $35 CDN a year, and includes a subscription to the club newsletter PHOENIX and full use of the TAF Online BBS. A membership in TAF IS Atari support!

Eh Beavis..the Imation Superdrive has shipped...saw one today.., plenty of Epson printers and USB stuff. Nope..You can pick one up at one of the seven Computer City ones - I wonder I get to go up north...Plus the countless resellers..

Funny, I did not see a milan or hades at Comp and Computer City recently.

> It makes sense that you'd post a press release, seeing as you're
> nothing but a mindless Steve-Jobs-butt-kissing parrot......

Saids whom...

I was watching the clean up of the tragic plane crash off Nova Scotia(sp) recently.. What I was amazed is that up north has a Coast Guard, naval vessels and yes naval helicopters...Maybe up north can contribute some of those fine naval assests if we down south have to go back to Kuwait and Saudi....-)

Oh, you do? You pitch Macs as your job and you pitch them on here. How is that keeping your professional work separate? The difference, I guess, is that you throw out all interpersonal skills when you post on here, as you go into this pathetic bash Atari mode. As for where you are located, I don't care.

> >   oh, NOW you've done it! TIFKAS will soon come in and have another
> > one of his hissy fits!
> Please explain..

The person you slammed in the alt.nerds.obsessive newsgroup as being one who never kissed a girl, but inflated one, is just predicting you will come on here and become irate once more.

> >   (BTW, thanks for posting TIFKAS' posting history - confirms what
> > I've been saying all along about him......)
> Please explain...

He is commenting on my post that contained your posting statistics. These statistics show that you are obsessed with bashing Atari, for one reason or another. Also, I commented that you can deduce from the posting patterns that you are a coward, because you never once posted a pro-Mac message on a PC advocacy newsgroup. You are an obsessive coward that has nothing better to do with his posting time than to take shots at the company that once was Atari.

Thing is Peter, that you just don't get it. You advocate the Mac on here as a means of bashing the company once know as Atari.

> > As for myself, I have some emotional sentiment for the Fuji symbol, so I pop

I think it is WHAT'S not WHATS but I am not going to go into a bash punctuation trip now. As for my point of this above blurb, explains a wee bit of my background and the fact that each time I read about the IMac, I associate you and your pathetic promotion of this half-ass machine that doesn't even come with a floppy drive.

> > Heck, if he REALLY insists on fighting Atari, he might as well bash Midway

Me hmm... aren't you obsessive, in regards to your posting patterns.
I
also think you have the wrong word here, because what I wrote above is not a sign of paranoia. I suggest you use your library science degree and find a more fitting term. The fact is that it is pathetic your obsession with bashing Atari.

-Richard

debate is welcome. Howver, mean-spirited drivel (which includes bragging about being a "macho stud" and using women as doormats, making fun of people's weight) in lew of debating the facts (which you tend to dodge, ignore or don't have) isn't. As well as having to make up stuff about Atari computers from whole cloth. But then, what else do we expect from someone who can't use Viagra because it only makes you taller?

But keep posting anyway, as we all need a good laugh. After all, a clown is funniest if his pratfalls are unintentional :)

    gee, how does TIFKAS find the time to post all his mindless drivel?
Could it be that his job, bank account, car and many, many girlfriends
are as phony as the "12 30-foot high piles of Mac software" he
constantly brags about?

    ask Steve what sort of favours TIFKAS had to perform in order to
keep his job with Apple (hint: his tongue and Steve's shoes)

Thanks Daniel.  Let me know their thoughts on it.  I talking with
someone right now that was in the sign making business for many years
- we're discussing the pros and cons of vinyl instead of the KIP
output.

Sorry it took so long to respond.  Both of my vehicles are having
major problems - even though one has been in the shop for 4-1/2" &
many dollars.  So between work and trying to get them going I've
hardly been in the house for days.

Terry

there is gnu C (gcc) and perl and cgi for the Atari also I beleive.
cruise some ftp sites or search the web.

dunno about western australia, but you could try new zealand! :^)

hardly. Sir Clive Sinclair, from what I've heard, is a kind, intelligent, honest, talented individual who knows what he talks about, wheras TIFKAS (The Idiot Forever Known As Sinclap) is the complete opposite- indeed, TIFKAS is the "anti-Sinclair".

BTW, I love the UK - already planning my possible fourth trip for spring. Perhaps visiting Surrey next time?

Yes it is. Simple a question of harddiskdriver.
Use HDDriver 7.5 from Uwe Seimet.
I know I can format at least the first partition in dual TOS/DOS mode.
That accounts for max 1 Gb.

Also there is something called BIGDOS going araound for free.
Makes the filesystem DOS-compatible.

    checked it out. Got a 404.

    now even the websites TIFKAS trolls us with are non-existant.

    but then again, TIFKAS is a 404 himself......

CAB has nothing to do with it - that's the report I get from the ISP I use. The web browser has nothing to do with it.

Interestingly, from tests I've done with my manager, Netscape and IE4 doesn't recognize HTML files unless they have .HTM at the end of them. CAB can recognize the code right off regardless of a suffix or not.

Plus, CAB is not as big a resource pig as Netscape or IE4 and gets what needs to be done done simply and elegantly....

I guess we can add WWW browser software to the long list of things that TIFKAS is not an "expert" at......

Oh, but a lot of Atari users won't believe the facts, and will just go on
believing their little fantasies.

> >> The ST OS is very stable
> >
> >ROFL..

And you obviously are no expert on Amiga OS, otherwise you would know TOS is and always has been the downfall of the Atari systems. The Falcon was a fine machine, except for that pathetic excuse for an OS.

```

Yes, but where can you buy a real, brand new Atari???

Atari is dead, but the Amiga has survived... and you can still buy new machines.
In fact demand for new A4000T's outweighs supply, and there is a waiting list.
FYI, there have been, and are Amiga clones - Draco being one, and a new English made one who's name escapes me. There is also a WebTV type thing marketed in asia which is based on Amiga technology. (officially licensed)

How many companies are there still developing hardware/software for the Amiga platform compared to the Atari?

Regards,

Clockmeister.

There are plenty of clones. Checkout Amazing Computing and the English rags..

Plus Amiga OS 5 will be out..

   Actually, I think I will pass. I have no interest in this. I would rather
focus on other things. In addition, I refuse to help transform these
newsgroups into a Mac bashing newsgroup. I like to keep the subject on-topic.

>   hmm, don't have many PC users here - you'll fit in quite nicely....
    Well, after my problems getting software for Atari 8-bit computers
(*sniff*) I had a chance to either get an Atari ST or a PC. Someone talked me
into getting a PC, which ended up being the best choice. Call me a sheep,
Sinclair, I don't care. At least when I go into a store, I cna get software.

Technically, we don't know that President Clinton didn't "keep his
pants on" - we only know that he didn't keep it in his pants.
>>
>>Clinton is directly elected and can't be bounced except for treason.

> I believe that conspiracy to mislead a grand jury is also a felony, is it
>not? That's probably the whole focus of Ken Starr's current investigation -
>whether he instructed or cajoled Monica about lying about their relationship.

Whatever people may see in the current situation the fact remains that
the statute empowers the special prosecutor to look into a specific
alleged criminal activity. Mr. Starr still calls his investigation
the "Whitewater investigation". Without the backing of a congress
controlled by the opposing party there is no way that this
investigation legally should have left the confines of a failed
twenty-year-old business deal. No Travelgate (how ridiculous, all
administrations bring in their own people). No Filegate (the Chief
Executive by definition has access to records of an agencies within
the Executive branch, especially when they're stored in the White House).
No investigation of the death of Vince Foster. No aiding in the Paula
Jones case (Mr. Starr was one of the first lawyers to volunteer, and
afterward provided all of his advice for free). And no investigating
whether or not Monica Lewinski gave President Clinton a hand or blow job.
Whether or not Mr. Clinton was wrong in what he did, it should have never
seen the light of day in this venue.

Some little known facts are that:

- If Mr. Bush had remained president, Mr. Starr was to be
  recommended for a Supreme Court appointment.

- Mr. Starr is and always has been a tobacco company lawyer and what better way to blunt the thrust of a percieved anti-tobacco president (and yes, I am a smoker).

- Mr. Starr, within three days of being appointed Special Prosecutor indulged himself in a little conflict-of-interest. His Kirkland & Ellis law firm, from which he did not severe ties was being sued by the RTC (Resolution Trust Corporation) for its connection to a failed bank. Within three days of being appointed, Starr started using his unparalleled powers as a special prosectutor to begin investigating the activities of the same RTC officials who were involved in the decision to sue his law firm. Starr's law firm settled out of court in January of 1996 for $325,000 -- $700,000 less than the RTC had predicted it could have gotten in a trial. Starr said that he did not know about the case -- which the RTC filed in May of 1993 -- until October 1995, even though he served on the firm's management committee (yeah, his secretary forgot to tell him that there was a one million dollar lawsuit against his company). This from the same man that threatened imprisonment to people because they could not remember details from a single afternoon twenty years in the past.

- Mr. Starr, who claims he is only pursuing the matter to determine whether there was perjury or evidence of suborning perjury has already been found guilty of both. It has been proven that he not only deliberately leaked information about his investigation (which in itself is a crime, and the first time in the 23-year history of IC's that one has even been accused. Mr. Starr not only lied to the court about having done so, it was determined that he had instructed his attorneys and investigators to lie about it also.

- Robert Fiske, the earlier Whitewater investigator was removed because Republicans claimed that he had a conflict of interest , in that his law firm (no him individually) -- from whom he had taken a leave of absence -- had represented International Paper in the past. When he was appointed as Whitewater Independent Counsel, Kenneth Starr _himself_ represented International Paper, which had sold land to Whitewater Development Company. As stated earlier, Mr. Starr maintained his ties with Kirkland & Ellis.

* The point of all this is not to revile Kenneth Starr. It is to show that he was a man with an agenda. An agenda that could hardly be termed "Independent." An agenda that neatly meshed with the interests of others who were able to ensure that he could continue his investigation in any direction that he wanted. Anyone that didn't mesh as with with the motivation of particular political interests would have been canned within two weeks of anyone uncovering this information. The media new about it, but sensationalism sells. Most people did even hear about it. And when your raised on soap operas where people are murdering their mothers and raping their neighbors dogs, they want to hear the sensationalism.

Some things I don't like:

- Kenneth Starr earned over one million dollars from his private practice in 1995, while he was supposed to be dedicating himself with investigating Mr. Clinton.

- More than eighty million US dollars has been spent on investigating Whitewater over more than six years.   In fact, the FBI provided more resources to this investigation than to the World Trade Center bombing. When you spend this type of money, and use these unlimited resources, do you really think that it's strange that they eventually found *something*????? What you should really find strange is that the only wrongdoing that the president has been found to have engaged in was getting a little on the side. I agree that that is wrong, but I do not agree that it is criminal.... worth >eighty million dollars.... or worth six years of devisiveness and making the United States appear to be a laughingstock to a large portion of the world.

I am not saying that your belief that he is "a turkey and should do the right thing and resign" is wrong. It's your opinion and is just as valid as mine. But I agree with him that this was politically motivated and it was none of their business. I don't ask the grocery clerk if they are an adulterer and if I find that they are put my groceries back and shop elsewhere. And I certainly wouldn't ask the fireman that came to my flaming house whether they committed adultery and if they have tell them to just go on back to the station.

OK, I've vented in an entirely inappropriate area. I apologise and promise that I won't continue this, period.

Terry

Instead, your stuck with a computer that is too limited to do work that many
```

of us take for granted.

> I notice, significantly, that the major thrust of the section was conveniently ignored. However, what's your point? That everyone should have broken into little clusters where no one could communicate with anyone else? That's absolute idiocy. I can pick up radio signals today with a seventy year old radio. Does that mean that technology hasn't advanced? And as far as being a great innovator by using long file names - sorry to disillusion you, but I was using long file names on my Convergent Technologies C3 system and Wang word processor long before the thought of the Lisa had even occurred to Woz or Jobs.

I'm wasn't trying to say that Apple invented long file names. UNIX has had 256 character file names since man crawled out of the ooze. There are times when you face a choice between compatibility and superiority. Apple choose superiority and I am happy with that choice.

> Stolen. You buy the ideas of others and then try to convince the world that they were yours, it's theft. As far as menu bars, radio buttons, check boxes etc. go you are just (I have no idea whether it is consciously or you just really don't know) perpetuating another Apple fostered myth designed to delude the gullible, uninformed or uninterested. All of these features were available on government, university and industrial CAD/CAM programs as long ago as the early seventies. The fact that they were only available on an application by application basis and that Apple stole the ideas for use system-wide does not make it any less of a theft. Perhaps you don't like hearing the words stolen or theft - guess what? I don't like hearing the word innovative for ideas that Apple did not originate.

When has Apple said that they invented the GUI? Please give a reference for this.

> Yes, and don't the bean counters love it when you do. I'll ignore the comment about the Atari since I happen to know what my machine is capable of and you're guessing.

There are two ways that you can run an engineering company: the bean counters can tell the engineers what they are allowed to have to do their jobs or the engineers can tell the bean counters what they need to do their jobs and the bean counters can work their buts off trying to get it for you. The later is a far better model and, fortunately, how it works at our office. But Atari users can't get good jobs so they will never know :-)

> So is plain HTML 2.0

It depends on what you need out of the presentation. Plain text might be good more some presentations, HTML for others and Shockware for still others. Limiting your access to technologies is, well, limiting.

> So is plain HTML 2.0

Java is very handy for navigation. Don't you like menubars? A lot of sites allow you to use a Java menu system for navigation.

> Why, am I illiterate? Can I not read? Why waste the bandwidth?

I find it hard to read while I'm going something else (but Atari users, I've heard, have eye stalks so they don't have this problem) but I can listen to a conference presentation while still working.

> Actually, you have absolutely no idea of how limited or complex my/our

Here's the question of they day: how many lines and gauraud-shaded polygons can it render in a second? I spend most of my time writing SV software so those attributes are pretty important to me.

True, but what's your point? Apple didn't make any design compromises for
compatibility. Atari made a big compromise for very limited compatibility.

>   They run Apple system software well enough.

You must have meant "ran" here. Yeah, the Mac Sac was great. It cost be $300
and half the programs that I wanted to run didn't work.

Sigh, there is just no reasoning with Atari users.

<Blush> Actually, I don't use my Mac very much anymore. PC development pays better these days and my PII-400 is much faster than my Mac (or any Mac). I am still writing freeware stuff for the Mac and hopefully I'll get back into the Mac scene when Apple starts making some good products again. Not that I am very hopeful. There is an on-going discussion in comp.sys.next.advocacy about how Apple is ruining OpenStep (my favorite operating system) to make it run Mac OS applications better. They also got rid of the shell and command line. Atari doesn't have the market in corporate stupidity cornered. As I said before, I haven't used a modern Atari enough to respect or disrespect their use. I bought a Mac Plus because I was having problems getting software for my ST. I probably used it for 2 years after that to play Barbarian and SubBattle (the Mac version sucked).

> Besides, any Mac user who agrees with me that Sinclap is a

People who only had Ataris?

> 3D games have been available for the Atari since it was first released. Most flight sims were in 3D, along with Elite II and a host of others. How about 3D Construction Set or Persistance of Vision?

I remember two harrier sims for the ST. One was wire-frame and so bad that the programmers probably comitted suicide after it was released. The other one was almost as bad and not fully 3D. In any case, I was refering to professional 3D work, not games. Atari computers have always been, and will always be, too slow for this.

> DHTML, Javascript and Java are all unnecessary, untested features for idiots to try out on their web pages, along with the <BLINK> tags and MIDI background melodies. I do hope for CSS support soon, though.

DHTML, Javascript and Java are very useful. They can all save bandwidth if used correctly. They can also enhance the user-experience of your site. But, of course, if you don't have it then you have to say that you don't want it :-)

BTW, this thread is getting too serious and I've gotten a few insulting e-mails. Maybe we should drop it.

     Many? The vast majority of people don't do much more than
     we all were doing with 8Mhz 68000s 10 years ago. There's
     a bit of the bigger and better but not much has really
     changed. That's likely the reason for the rise of GNUware.
     People eventually got tired of continually paying again
     and again for what was esentially the same thing for over
     a decade.

     The long filenames were never the problem. GCR was.
     They could have come up with vfat 10 years ago if
     they really wanted to be crafty. Instead they created
     a little ghetto for their users.

You forgot the more realistic model. Real engineers consider
real concerns and constraints. One of those is cost. Another
is interoperability. They also consider the specific task at
hand.

Sure, IE and Navigator just love java... crashcrashcrash...

That's the sort of thing that sensible users immediately
disable, actually.

The ST ran any Application that it would make sense enough
to run under CPU emulation quite well enough actually. Also,
universal storage is far from limited.

>
>>   They run Apple system software well enough.

Spectre GCR actually and it ran rather better that you
give it credit for. There really wasnt much to emulate
in an old mac anyways. Hell, the PC's of the day had more
in the way of support processors.

Actually, I'm a linux user. I can do the streaming
video thing as well as the streaming audio thing.
They just don't impress me as I would rather not
deal with communication glitches while playing my
media. My expectations are higher due to previous
experience and I'm not taken in by some minor glitz.

I can use as much in terms of resources to use a
given task as I want to and am not required to
keep up with a pointless technology race just
to deal with the stupidity in Cupertino or Redmond.

It's interesting that a MacVocate would so ignore
UI design. Although an anti-CLI bigot like you
likely would discount the possibility of UI design
in a character cell based system.

So? Most 'modern' Macs and PC's are too. Non-Amigas only caught
up with Amigas in this respect just a few years ago. Previous
to that it was either a toaster or an SGI.

What was available for the ST was comparable to the rest of
the sub-MiniComputer software available at the time.

I use an AMD k6 @166MHz with 48Mb of SD RAM, a 24x CD-ROM drive, a 2gig HD, a 33k modem, a stereo 16-bit wavetable synthesis soundcard and a 4meg SVGA graphics card ...

i use it a lot for the internet looking for news about and software for my Atari STe @ 8MHz with 4Mb of RAM and a 20Mb HD, the happy workhorse at the heart of a semi-pro recording studio ...

comparing clock speeds alone the pc is 20x faster than the STe, it has 12x as much memory and 100x as much HD space ... but then the pc cost 1200ukp whereas the STe cost me a 1/20th of this at 60ukp ...

ironic huh?

jim

Actually, I am very pro CLI.

Yeah, I moved from SGI to PC about 8 months ago. SGI deciding to build NT PCs was like a kick in the stomach and made us look at PC solutions. OTOH, it's nice to be able to do development at home without hauling $40000 of equipment home every night (I had to get personal insurance to cover it).

We are flip-flopping between now and then, I guess.

> They crash Windows/Mac browsers far to frequently to be

Javascript crashes Windows/Mac browsers frequently? A lot of pages contain Javascript.

But I also realise that my time is worth more than a PC. My personal workstation used to be an Octane. Spending a few grand on a new computer is worth-while even if productivity only goes up a few percent.

> Got a good example of a 'useful' Shockwave?

I don't have a URL handy. The last conference that I went to had a Shockwave version of the Director presentation on the web.

> ...and you rather likely use special purpose hardware
> for it (that wont necessarily be present on a new Mac or

Of course. Oxygen cards are pretty popular at work these days. But I can get them for my PC and I couldn't for any Atari.

Redmond is still trying to catch up with MountainView. For the next few years,
at least, my productivity is very proportional to the speed of the computer
that I use.

6 months ago we were asked at work to disable Java (I forget the reasons
why)
and to tell you the truth I have not noticed *any* difference at all
while
surfing. This makes me curious as to what the hell Java is used for?
Whatever it is used for, I never used it or came across it while
surfing,
so what is the big deal??
One thing that pisses me off I'll say is so called reference CD's that
are
propriatory, hooked into some OS. I've yet to see a reference CD that
had
effects that were any different than what I can do on the web. So I have
a CD that can only be used on a MAC or a IBM, not an Amiga or an Atari.
If that reference CD had been writen as if for the web, then _everyone_
could use it. UNiX(Linux), Amiga, Atari, MAC, IBM(DOS or Windows),...

Oh man... PCs are bland, Macs are far from bland. No other computer
has this huge following, almost a religion, behind it. Not even your
precious Ataris. Not even the "cult" Amigas.
I'd take an Atari any day over that Pentium II you lust for. Of
course, I'd much rather have an iMac :)

Your opinion. I'm currently looking for one of those early
all-in-one Macs. They're simply wonderful to look at, while STs aren't.

GEOS? I beg to differ. If there's something that looks like GEOS, it's GEM, not MacOS. You're right about the Mac using non-standard stuff, blame it on Steve Jobs.

But Ataris are also problematic. I'm currently facing a big problem. No composite output, no "standard" RGB output. I can only use the stupid b/w monitor or a freaking RF modulator. Dang...

No matter what you say, Apple was innovative back then. What machines were available in 1984? Any Xerox machines that you could buy? Don't think so. People were stuck with DOS (8.3!) text mode.

Guess what. If it weren't for the MacOS, Amigas and Ataris wouldn't have a GUI.

>

Ataris didn't had colour in the productivity mode (640x480), so there. OK, you said Atari was keeping up with the rest of the world. But the thing is, they were trying to keep up with Apple's developments!

>

Humm... Wrong. Macs aren't obsolete. Vintage Macs can do exactly the same as your vintage Atari can do, even more in cases, due to the abundance of software.

You have to realize that nobody's forcing you to use the latest, greatest versions of the software out there. That's the difference. While Atarians are stuck with old versions of their software, Macs have an old backlog of software that users can choose from.

I've conceded to him on some points in the past, and even he's admitted some of my points have merit.
>
> <Blush> Actually, I don't use my Mac very much anymore. PC development pays better these days and my PII-400 is much faster than my Mac (or any Mac). I am still writing freeware stuff for the Mac and hopefully I'll get back into the Mac scene when Apple starts making some good products again. Not that I am very hopeful.

You should be. I don't see what's lacking in the current product line that would appeal to you. What would a "good product" be for you? Apple's constantly upgrading and enhancing their products. Third-parties are also releasing more and more upgrades, boards, etc. For once I'm able to say, the future looks great. I wouldn't tell you this a year ago.

> There is an on-going discussion in comp.sys.next.advocacy about how Apple is ruining OpenStep (my favorite operating system) to make it run Mac OS applications better. They also got rid of the shell and command line.

No, they didn't. MacOS X Server (previously known as Rhapsody) has the command line intact, and can run MacOS applications in a controlled environment. MacOS X will mix classic MacOS and OpenStep. It'll be a consumer-oriented OS, which OpenStep (or any Unix for that matter) wasn't, so don't expect command lines and things like that. That's why they kept Rhaps.. ermm.. MacOS X Server :)

     Why not. An OS not merely designed to steal other people's
     innovations should be able to manage more than just FAT12
     and still be able to format an ext2fs floppy should
     portability be no concern.

Yes actually. They came out in '83. They were just somewhat
high end rather like Macs actually.

>Don't think so. People were stuck with DOS (8.3!) text mode.
> Guess what. If it weren't for the MacOS, Amigas and Ataris
>wouldn't have a GUI.

No, they just would have stolen the idea from it's source
or the Athena team. Phoenix and Compaq did more to bring
the GUI to the masses than Apple ever did. Apple 8bits
were selling for 3x what my ST cost me when I got it.

Or rather PARC developments while still making the machine
accessable while Apple was charging over a grand for 8bit
Apples.

Sure & when an Atarian wants to run MSWord or IE, they can
just get the $100 or $500 clone special and save a bundle
and run a whole bunch of 2nd tier cheap games while they're
at it.

That text wasn't nice, it was deplorable. Text can be good, but the interface
has to be good, too. MS-DOS never had a good interface.

>> Who in the world would want to run DOS?

>People who only had Ataris?

Why would anyone want to run DOS? I find it akin to torture, despite being a fan of shells.

There were a lot of better games that you didn't see, then, such as Frontier.

As for professional 3D, I take it you are refering to raytracing and the likes. Granted, the Atari was never much of a contender there, all the good programs were/are for the Amiga, but that was the case with most other platforms, too.

Unfortunately, idiotic web page "designers" with little knowledge of the realities and concept of the web seem to think that it is a necessity.
I for one have never missed the pop-up adverts or floating ghost logo of Geocities.

>BTW, this thread is getting too serious and I've gotten a few insulting e-
>mails. Maybe we should drop it.

Not that bad, in an over-saturated market, but with a limited number of Mac-
users, Apple will soon have to target another audience than the MacAddicts.

Yes, that is a great answer. Why not change your email address, web page
URLs, preferences and habits? I haven't changed ISP in three and a half year,
and no Mac will make me do it.

They were cheap as dirt, not luxury articles for the people who already had everything. And things could be done with them. For those who couldn't afford a Mac SE with its 9" screen and Pagemaker, there was the Atari with Calamus. For practically every MIDI musician, there was the Atari with its built-in MIDI ports and Cubase.

>> So? How much does your T1 cost you?

>I don't have a T1 at home. A lot of those technologies are pretty easy on
>your bandwidth.

Not to mention quite useless. Novel at first, perhaps, but they haven't found their way onto any PC or Mac I've been using.

     Actually, streaming audio and video can be problematic even
     on a cablemodem. The catch with these things is that you're
     dependent upon every node in the chain between reciever and
     sender. A bottleneck in any one of them and your nice media
     toy goes out the window.

>
>Not to mention quite useless. Novel at first, perhaps, but they haven't found

Why not? All you have to do is come up with a single counter-example and my
argument is toast. But I doubt that you can do that in this case.

It would need to have fast 2D and 3D graphics. It would need to have three
free PCI slots. It would need to have preemptive multitasking. It need to
have fast file I/O. It would have to run some of the more important 3D
applications such as Wavefront and SoftImage. It would have to have a memory
architecture capable on handling large working sets.

No, they didn't. MacOS X Server (previously known as Rhapsody)
> has the command line intact, and can run MacOS applications in a

> they kept Rhaps.. ermm.. MacOS X Server :)

Apple hasn't committed to updating Mac OS X Server beyond it's initial
release. That will probably make it a dead product before it even ships.
Taking away the command line is just restricting the user for no reason. And,
keep in mind, command line utilities are useful for GUI programs. For
example, say I wanted to add a check box in the save dialog of my application
so the user could choose to automatically compress the file upon save. In OS,
that would probably take about 5 lines of code because I'd just call gzip.
Without the shell and standard utilities, how would I do that in Mac OS X?

Well, there is the point that a significant proportion of the postings
are actually discussing the capabilities of Atari computers, although
someone looking at the subject lines would never be able to guess
that. May I suggest that if you are going to complain about
Atari-related postings being posted in a thread with a Mac subject
line, that you don't put the post into a thread with a Mac subject
line? :) - That's a joke, btw... seriously, start a thread.

Terry

What Atari clones can use Voodoo 2 cards? Are this Intel based? Who writes for
drivers for these cards?

There are no PC Voodoo II cards that will work on a Mac so I would assume that there is some component (hardware or firmware) that is tied to the PC architecture. If you want a Voodoo II card, for then Mac, then your only choice is the GameWizard.

> You really should know just a 'little' about 3D chipsets
> if you're going to rattle on about polygon counts and such...

Why do you think that I know less than a "'little' about 3D chipsets?"

BTW, are there any shipping Voodoo II cards that work in anything other than full-screen 3D mode? If not, then they are pretty useless for doing SV work. I personally have an Oxygen 202 card in my work computer. It scores about 19 on CDRS-03 and was only $2000 Canadian. That's slightly better than a low-end Octane. How do the Voodoo II boards do?

And could you please both some more information about the Atari compatibles that you were refering too?

Why shouldn't a consumer-oriented OS retain the CLI? Both AmigaOS and Windows
do.

I think the design of the ST/Falcon case was nice. The keyboard computer design is not very space-demanding, and portability is easy, too. I find the function keys integrated into the case a rather nifty design, too.
Of course, old Macs are cute as well, but the big boxes are very ugly.

They're all black and white, I can't see much difference. They all had windows, menus, sliders and gadgets.

>   But Ataris are also problematic. I'm currently facing a big problem.
>No composite output, no "standard" RGB output. I can only use the stupid

Looking in a Datic catalogue from a few years ago, I find a Scart/Peritel cable for the ST, connecting to the monitor output. Is this what you're looking for? Anyone with a soldering iron should be able to construct one for you.

Drivers for Insmell cards are not such a problem. Computerinsel has
been doing this for quite some time for TOS machines. But, as the
posted stated, some pleading would probably be necessary. There are
probably enough Hades, Medusas and Milans to temp them

In his recent attacks against my credibility (which has so far been monumental failures, owing to his lack of same), TIFKAS (the Idiot Forever Known As Sinclap) has made claims that President Bill Clinton cannot be impeached if any charges regarding the allegations he deliberately conspired to mislead a grand jury over Monica Lewinsky come to bear, as a president "can only be impeached for treason".

BZZZZT! WRONG! Here's what I found in the Groliers Encyclopedia CD-ROM when I went to search under "impeachment". Read it and weep, weinerhead......

FROM THE NEW GROLIER MULTIMEDIA ENCYCLOPEDIA, RELEASE 6

impeachment

{im-peech'-ment}

Impeachment is the first step in the process specified in the Constitution of the United States for removing the president, vice-president, or other government official from office upon conviction of "treason, bribery, or other high crimes and misdemeanors." The House of Representatives has "the sole power of impeachment," that is, the power of bringing charges. The Senate has "the sole power to try all impeachments." A two-thirds vote is required in the Senate for conviction. When the president is to be tried, the chief justice of the United States presides. Conviction in an impeachment proceeding results only in removal from office and disqualification to hold "any office of honor, trust, or profit under the United States." A person convicted in an impeachment, however, is subject to further "indictment, trial, judgment, and punishment according to Law."

Impeachment originated in England, where the House of Commons would present articles of impeachment to the House of Lords, which then tried the case. A well-known instance was the impeachment and trial (1786-95) of Warren HASTINGS, first governor general of India.

The framers of the U.S. Constitution, although committed to a separation of powers and independence of the three branches of government from one another, believed that a means must be provided by which officers thought to be guilty of significant misconduct could be tried and removed. They did not want the procedure to be overly simple to invoke, nor the penalty too easily imposed--hence, the requirement of the two-thirds vote for conviction in the Senate, and the stipulation that impeachment be for "treason, bribery, and other high crimes and misdemeanors." To George Mason's suggestion that "maladministration" be a ground for impeachment, both James Madison and Gouverneur Morris objected that so vague a term would surely produce the result that tenure in office would be at the pleasure of the Senate.

Since the adoption of the Constitution, only one president, Andrew JOHNSON (1868), has been brought to trial in the Senate on charges voted by the House. The Senate failed by one vote to convict Johnson. In 1974 the House Judiciary Committee voted three charges of impeachment against President Richard M. NIXON (see WATERGATE), but he resigned from office before the charges could be voted upon by the House.

Impeachment proceedings have been brought with some frequency against federal judges. In 1804, Supreme Court justice Samuel CHASE was impeached on purely political grounds, but his acquittal (1805) effectively halted the use of impeachment to remove judges for political reasons. It has often been said that the cumbersome and time-consuming process of impeachment is unsuited to the removal of a merely venal judge. Nevertheless, because the Constitution specifies that judges hold office during good behavior, impeachment remains the only means by which a federal judge may be removed.

Certain questions concerning the impeachment process have persisted: whether it is judicial or political in nature; how to define high crimes and misdemeanors; and whether a conviction can be appealed to the Supreme Court. Although no conclusive answer can be given, it is safe to say that the judicial process of impeachment will always be infused with political motives; that the definition of high crimes and misdemeanors will never become entirely precise; and that once the Senate has voted to convict by a two-thirds majority, the Supreme Court is unlikely to take jurisdiction.

Valerie A. Earle

END QUOTE

I also fail to see how being in violation of the US Tenure Act (a charge trumped up by those senators opposed to Andrew Johnson when he fired his Secretary) can be seen as "treason". Also note that Nixon had THREE charges of impeachment (which he deserved) placed against him - I'm sure all three charges were NOT "treason".

Now how did the University of Iowa (a good accredited US university) manage to give a sheepskin to such an unmitigated schlemiel like TIFKAS? Maybe he was playing Space Invaders on his Mac and playing hooky from his political science class the day his kindly old history professor talked about impeachment. Or more likely, he was too busy in the library playing his childish flaming tactics on the USENET that day.

In any case, TIFKAS has proven that when it comes to understanding the US Constitution, he is as good an expert as General Alexander Haig was the day Reagan was shot - and like Haig, neither of them are in control (the fact that both TIFKAS and Haig are both tight-assed idiots who love twisting definitions and explanations - remember Haig's testimony about the nuns who were raped and murdered by right-wing troops because the nuns "were trying to run a roadblock", which he then claimed he never said - and who were both undone by putting their foot in their mouths, adds weight to my description. Haig helped destroy Commodore as part of his being part of the "Three Stooges" in charge of the company; TIFKAS destroys any interest people have in checking out the Macintosh every time he posts his self-serving drivel on the USENET)

In any case, the fact of the matter is that this information was found on the Groliers CD (a wealth of information and a recognized scholarly tool) on an ATARI COMPUTER (using my friend Peter Zalesak's SARA Groliers driver) - ironic in view of TIFKAS' continuing insistence that Ataris are good for nothing except the slag heap, and that the Mac is the superior platform (fact is, they're at par with each other, and equally useful).

The matter of the definition of impeachment is now closed. I'd also like to close the discussion of poiltics, as it is an inappropriate area of discussion in a COMPUTER FORUM. The continued debunking and exposing of TIFKAS as the world's most clueless Mac Advocate continues......

another tidbit from comp.sys.mac.advocacy for TIFKAS to chew on....

Mike Tebbe at InfoWorld just released this gem to prove the title of his piece:

"Many enthusiasts think that just because the iMac has a 10/100Base-T connector and an easy-to-use interface, it will readily connect to any network. It won't -- unless you happen to have an AppleTalk network still running. And when you consider the limited engineering resources of many networking vendors along with Apple's limited market, the iMac doesn't seem destined to have network drivers anytime soon."

"http://www.infoworld.com/cgi-bin/displayNew.pl?/tebbe/tebbe.htm Apple
may be back, but it still doesn't prove t�</A>

Perhaps he could use a little (Skinnerian-type) feedback?

I'm not sure what this article means as the iMac would have no problems functioning on a TCP/IP network. Just go to the TCP control panel, select ethernet as the connection device and either type in your IP address or choose a method of getting an IP address dynamically. It should take under a minute to do this.

just finding little things that might be of interest to everyone, as everyone should get the full story about the iMac, rather than TIFKAS' mindless postings of Apple press releases. BTW, you'll also notice that many of the links to articles I've provided do have some positive things to say about the iMac as well - although I feel the iMac is flawed, it does have some great aspects to it, and I'm not afraid to have those mentioned. Let's just see how well it wears over the next year as technology marches on......

I've noticed that perhaps for the past month or so, articles soley pertaining
to Macs have been appearing in this (comp.sys.atari.advocacy) newsgroup.
I am extremely curious as to why. I think Macs are fine computers, but I did
not subscribe to THIS newsgroup to read about Macs.

     You can also set up a Falcon running Linux to be an
     Mac fileserver. However, it might not be something
     one would expect the target market for the iMac to
     accomplish.

     For the iMac, a dhcp client and configuration utility
     at least on par with what one can get under Linux
     should be a bare minimum in terms of functionality
     delivered in the box.

ROTFLMAO! Thanks, Jedi.

and as usual, TIFKAS gets it wrong yet again! The TT, MegaST, and
MegaSTE had expansion slots for installing graphics cards and internal
SCSI hard drives; the Falcon has an expansion slot within it for a
number of different uses and has an internal IDE interface, as well as
external SCSI. I believe that all these were new models, as well as the
STacy was.

And I would consider the release of the 1040STe a timely upgrade
that fixed many of the flaws of the original STs, including bigger

colour palate, standard SIMM upgrades for memory, stereo sound output, improved hardware scrolling, etc. It's probably the most desired of any used ST model. And at a much cheaper price than any Mac at the time.

The Milan I would also consider to be a timely (and cheap!) Atari upgrade solution. Check out the web page at http://www.milan-computer.de and weep, weinerboy (and don't use the excuse you can't read German, TIFKAS - use AltaVista's Babelfish function to translate it. That or invest in a REAL web browser like CAB and get the GEMtrade module :)).

If you're going to debate, TIFKAS, at least be sure to make sure you have all your facts straight. (That includes mindlessly parroting Steve Jobs, who's now been caught with his pants around his ankles with his blatant lie about the iMac's speed; see http://www.apple.com/pr/library/1998/aug/13fast.html to show he DID say it)

I wait with baited breath TIFKAS' reply to this, which of course will include some lame insult and/or unproven smear against my character (of course, it'll have to wait until he's finished watching Teletubbies......)

The Mac was just as lacking in the expansion department as the ST line.
As for upgrades and new models, that was true, they got lazy.

     However, TOS and GEM weren't overburdening the hardware
     that they initially ran on either. While MacOS was rather
     too fat for the original Mac hardware.

Boy the Networks don't miss a trick to spice up a show. Tonight on
Drew Carry, Mimi now has an iMac at her desk.
It really matches her makeup and attire.........

I wonder what C-Lab could do along the lines of the current iMac
commercials. Apple really does manage to depict what owning a PC is
like, but what would real computer users think of the C-Lab case
compaired to the iMac? I guess wanting to put a VCR tape in the C-Lab
is better than wanting to put fish in your iMac.......

The person that is looking for a Mac plus can visit our local thrift
store. The Navy base DRMO sells computers by the pallet. They are the
first thing the buyers dump after the auction. They go for $5.00 each.
Get one for every door in the house.
MG

This is the advocacy group.  Goto comp.sys.atari.st for the latest software,
hardware and technical updates.. Qut whining now..

Peter S.

If you ever should decide to move on to different
hardware, that Falcon could be quite nicely recycled
into an intranet server of some kind (linux).

True, but Atari never really seemed to care that computers became cheaper all
the time, so they just went on with TOS 2.06, despite all its limitations,
when modern computing would allow, even demand, more advanced solutions.

     Most modern computing wasn't able to deliver those
     'advanced solutions' without either unacceptable cost
     or crippling of hardware until after RAM prices came down.

     It's no small irony that Unixen are now considered trim.

         Because it goes against Apple's long standing tradition of
perceivably "simple" OSes. The "core" of the OS might be damn complex, but
it has to look simple.
         I like CLIs, but I think it would be a bad thing for Apple if
they included one with X (not X Server). For instance, an inexperienced
user could cause much more damage thru a CLI than with a GUI :)
         Oh, and, of course, since X will be running atop a Mach kernel
and POSIX layers, it'll be possible for third parties to port assorted
shells to the X environment.

Well, the case design of the ST/Falcon is definetely 80s... Not a
bad thing, but it's not a form factor known for its expandability (see the
Amiga line and the problems with the kludgy slots).
I don't think the "big boxes", as you put it, are ugly. The Amiga
boxes are much uglier, and the Atari boxes were just... awkward :)

Hummm... By your assertion, all OSes are alike, because all of
them have windows, menues, etc... What would make them look alike is the
"feel", not only the "look", which, in this case, are totally different.

SCART? What's that?
I could've built a cable to hook it to my TV, but I can't find
the stupid 13-pin RGB cable... It's not "standard" :(

While every PC Voodoo II card should work on the Mac, only one does (the GameWizard) because there are no drivers for the others. The GameWizard is deliberately different from the PC Voodoo II cards so that you can't download the GameWizard drivers and buy a cheaper PC Voodoo II card. Who makes Atari drivers for the Voodoo II card and what API do you use to access it? Can you use OpenGL or do you have to use GLIDE?

I can reformat my hard drive with a few clicks under the Mac OS. I could also drag my System Folder into the trash and my computer would stop booting. What additional damage could I do with a CLI? In OpenStep, without having logged in as root, you can't do that much damage with the CLI.

> Oh, and, of course, since X will be running atop a Mach kernel and POSIX layers, it'll be possible for third parties to port assorted shells to the X environment.

That doesn't help developers. OpenStep developers often leverage the built-in shell and command line tools to add important features with little effort. Apple is ending that era.

Great! Give the iMac users the true feeling of owining a PC. Sell them something one month, and release a newer product at the same price next month.

Did you read the NYT article about the iMac that caught fire in a womans apartment? She is sewing Apple for $11.7M USD.
Her lawyers claim the powersupplys in the iMac line are underrated and that every iMac user is in danger.

Encourage the spread of this message. It is a false statement on my behalf. I am not responsible for followups that do not contain this message.

Let me word that:

iMacs do not cache fire (unless you spill the water while filling it).

News aleart: Neon Tetras are known to cause screen burn if the quanity in the iMac exceeds 15 fish.

In double speak definition "TOS is not supported by Java so it sucks(Java)."
The world has fast computers to use Java. Time marches on.

TOS is small but is limited in what you can do with it today..

> Webmasters who make their sites Java-only don't deserve to be

Webmasters are not going to be dictated by a bunch of TOS whiners that want to

remain in the dark ages. They are going to push the envelope on web tool
technology to the fullest. In case you have not noticed computer power is
cheap..

While at Wal-Mart this weekend, I actually seen a bottle of fish food
specifically for the iMac. The feed were shaped in the form of an
sad face. Twisting the can open caused it to play the death chimes of
the iMac after Joe user trys to replace his memory. A rubber plug was
included to seal the monitor bowl from leaks while performing this
operation.

The first Neilson report released concerning the iMac said that it was
most used during daytime soap operas to log onto the shows site and
vote wether Charlieen should leave Rastus for having sex with her
sister and recording video clips of it with her iMac. The pictures
looked kind of blured with all the fish floating around the screen.

spoken by a true user of doublespeak - or should I say
doubleplusthinkgood?

>The world has fast computers to use Java. Time marches on.

and how many people actually use Java? It's dead as a doornail,
judging by all the articles I've been reading in the industry Internet
magazines. I notice that a LOT of interesting pages don't even use Java!
>
>TOS is small but is limited in what you can do with it today..

Nice try, but no donut, weinerhead - not as long as there's still a
use for it, and software developed for it. And now that I'm using MagiC
on my Falcon, the usefulness quotient has gone up considerably - and a
lot faster.

>

read the above again. The problem isn't TOS whiners, the problem is bloated and buggy code from guys who favor content over quality. There are more than just TOS people who complain about this, and you know it. We don't live in the dark ages, either, what with all the great Internet tools that have popped up in the last few years for the Atari, and is still being developed. And speaking of whiners......

They are going to push the envelope on web tool
>technology to the fullest. In case you have not noticed computer power is
>cheap..

oh, like the overpriced, underpowered iMac, which has been PROVEN not to be a "400mHZ Pentium toaster?"

TOS is fine, it's the memory requirements of any jvm and
the jdk that are a problem. Since there is a TOS version
of gcc, Atari programmers are more than able to take a crack
at porting any GPLed version of java. Just don't expect it
to fit within the usual hardware memory capacity of an ST.

Nevermind that one never can tell when any arbitrary java
applet on a page will take down IE4 or NS4.

No, webmasters are still worried about the bulk of PC users
still using slow serial connections and all of the softcore
novice users that really don't have the patience to view
media in anything other than realtime.

I dunno, a linux port might be more productive.
It would be interesting to see what they could
do with a more efficient Mac/PC OS with infinite
customizability

Then many platforms, one sourcetree, one command

```
     to build them all... make.

     Or... MagiC on top of posix could be interesting...
     Have the same sourcetree but just with GEM instead.
     (X is horribly bloated)

Beauford Lamont of Tippin Texas ask, I installed an iMac in the
back of my 71 Caddy Limo. The girls seem to like it real nice between
trips to the base. Is there any way I can keep the water from spilling
out the top of the machine when we start head'in fer home on the back
road? I've lost 6 Tetras this week alone, and my insurance company
says it dosen't cover portable fish tanks.

Is there a Comp USA rep in the state that could help with this
problem?

Also, Maxine wants to know if the NeXT iMac will be available in Pink.

Yours truely,

BL

Well Brian, everyone is entitled to their own opinion.  Whether Atari
computers suck or not, they have personality.  Which is a lot more
than can be said of those nice, safe, bland Apple and PC compatible
busses.  I've been involved with computers since the mid-70's.  I've
used and programmed everything from a single-board Sym through
mainframes.  In my opinion your precious Bloatware Macs & PCs aren't
worth a whole heck of a lot.  I'd love a nice Pentium II - I'd have
the fanciest wheel chocks for my RV in the neighborhood.

I was joking. Still, let's care this on for a while. It might be fun.

Atari computers have no personality at all compared to Macs. Look at all the STs. They look like giant door stops with cooling slits. Except for the ugly case and stupid integrated keyboard, they may as well have been PCs. The original Macs, OTOH, were nicely desiged little units.

And then there was TOS. It was the worst of all operating systems. It wasn't compatible with anything, used the stupid DOS filesystem and the GUI was so disgusting that you felt like using CP/M.

Of course, things have changed. Atari's are now using processors that are slightly better than those in our watches and the operating system is almost half as good as IRIX, linux, BeOS and OpenStep. OTOH, by offering low performance hardware and software, Atari allows the user to stay focussed on the past of computing instead of being caught up in silly crazes like 3D and the Internet.

Peter is a punk. I can even bad mouth better than he can :-)

gee, I think the Mac wasn't compatible with anything except other
Macs (and Mac-specific peripherals like printers). Ataris you could at
least transfer your work via their disks to other PCs - and you could
at least plug in industry-standard peripherals (though to be fair, the
Tramiels took several years before they finally put industry standard
SCSI ports on the Falcon. And the way Macs handle
disks - that seems to be pyschologically scarring having to pull the
disk to the trash to eject it. And that Mac operating system - shades
of GEOS if you ask me :)

Friend, ANYONE can post better trash-talk than TIFKAS (honestly,
"you will be eating your spinach" as a cutting insult? How lame). He's
nothing more than a pimple on the buttocks of progress (quick, the
Lanacaine!) :)

That's pretty shallow of you Brian. Equating personality to
cosmetics. True Dan - but they weren't even being original in a
computer sense - except for the color of the case it could have been
one of those Vectrex vector-graphic computers that failed early in the
eighties. Strictly cosmetically speaking, the original macs had about
as much personality as an upended breadbox. Now the Banana 2000 in
Bloom County... there was a mac-like machine with personality.

What a concept. In the same sentence you say both that it wasn't
compatible with anything and that it used the stupid DOS filesystem.
From the very beginning I could use any peripheral that I wanted.
That's compatibility that the Mac didn't have. I could access disks
from other Operating Systems. That's compatibility that the Mac
didn't have. So what if it used a proprietary OS? What, precisely,
was Finder, if not proprietary. I had access to emulators for most
machines... 8-bit on up.

Hey. If I want 3-D, I'll buy a playstation. I have it for what I
consider the important jobs on my computer, I don't need real-time

3-D. And what in the world do you think I'm accessing the internet
with? A PC or Macintosh that is misleading everyone into thinking
that it's an Atari?

Well - At least your attempts are coherent and intelligible - Even if
we totally disagree on almost everything. :)

Terry

This is too perfect, I can't touch it :-)

> gee, I think the Mac wasn't compatible with anything except other Macs (and Mac-specific peripherals like printers). Ataris you could at least transfer your work via their disks to other PCs - and you could at least plug in industry-standard peripherals (though to be fair, the Tramiels took several years before they finally put industry standard SCSI ports on the Falcon. And the way Macs handle disks - that seems to be pyschologically scarring having to pull the disk to the trash to eject it. And that Mac operating system - shades of GEOS if you ask me :)

Compatibility at the cost of having the stupid 8.3 limitation? Why not just run DOS in the first place? At least the DOS UI was better. And the Mac had a reason to be incompatible. Apple was actually innovative, unlike Atari was was just shouting "Me too! Me too!" at the top of their lungs.

> oh, silly me, I must be hallucinating that I'm posting this on the Internet. On An Atari. In real time. And who has time for that silly overated 3-D when you're getting so much work done :)

The reason we still use usenet is because people with Ataris can't participate in cool real-time online audio conferences like the rest of us. Atari has always been behind but now they are actually holding the rest of us up. And let's talk about browsing. How is the CSS, DHTML, Javascript and Java support coming? Atari users don't want to play 3D games because the 3D world is too complicated for them. Hell, most of them only move forward and back when they play frogger. And 3D work is hard, too hard for Atari users anyway so why add 3D capabilities to the Atari. Maybe in other ten years or so the technology of yesterday will be available for Atari. But probably not.

Not really. I don't use an Atari any more but I had an ST for several years. I haven't seen an Atari in a while so I couldn't really evaluate their present performance. But I bet that it sucks :-) In the rest of your post, you use the first person too much. That makes it hard to bad mouth the Atari without attacking you personally.

> What a concept. In the same sentence you say both that it wasn't compatible with anything and that it used the stupid DOS filesystem.

You couldn't run DOS applications. You were just stuck with the stupid file system.

> From the very beginning I could use any peripheral that I wanted.

Not SCSI peripherals, you couldn't. And getting printer drivers was a problem because printer manufacturers didn't give a crap about Atari.

> That's compatibility that the Mac didn't have. I could access disks from other Operating Systems. That's compatibility that the Mac didn't have.

Only file compatibility at the cost of using the most stupid file system to ever exist. Instead of blazing new trails like Apple did, Atari said "Hey, we're not smart enough to make our own file system so let's just use the worst one on the market!"

> So what if it used a proprietary OS? What, precisely, was Finder, if not proprietary. I had access to emulators for most machines... 8-bit on up.

So, why make a proprietary OS that is worst than other OSes on the market? If you can't do it very well, at least do a good job stealing the ideas of others.

> Hey. If I want 3-D, I'll buy a playstation. I have it for what I consider the important jobs on my computer, I don't need real-time 3-D. And what in the world do you think I'm accessing the internet with? A PC or Macintosh that is misleading everyone into thinking that it's an Atari?

The Playstation isn't going to run SoftImage very well, is it? And consoles are a waste of money anyway. Why buy something that you plug into a crappy TV when you can see the action at 1280x1024 without paying any extra money? And,

if you are willing to spend a few extra bucks, then you can get performance
that will destroy any console AND speed up your SoftImage work.

Sure, using your Atari, you can access a small subset of the content available
on the Internet. But some of use like Java, JavaScript, Shockwave, Flash, CCS,
DHTML, RealAudio, RealVideo, QuickTime, VRML, etc.

Really. And what is wrong with maintaining filesystem compatibility?
Absolutely nothing. It's only people that had a little too much
aluminum in their diets when they were younger that can't keep track
of things using 8.3.

Yup, Apple was being real innovative there. As long as you consider
stealing Xerox Palo Alto Research Centers Ideas part and parcel and
not only claiming them to be your own, but having the gall to try and
sue other companies that attempted to use a GUI.

Atari wasn't shouting "Me too!" Atari had an innovative system
(where, for example, was the color on the Lisa or Mac? - as just one
point). Atari was following its own path but maintaining the lines of
communication with the rest of the world. Whereas Apple was trying to

become a world unto itself.

Wow... I wouldn't talk too loud then. Apparently Atari users a quite
the significant force. Tens of thousands of newsgroups, each with
hundreds of posts a day. All because of Atari users.

>always been behind but now they are actually holding the rest of us up. And

Who is asking you to hold up? Go your own way. I'm sure that someday
you'll all have a nice little word processor that only needs a
terabyte of memory and parallel processing chips to edit a note home
to mommy.

>let's talk about browsing. How is the CSS, DHTML, Javascript and Java support

Now _that_ is sinclapish. Too complicated? Hardly. But I'll keep
this short so you can go back to playing your many-many-hundred-dollar
game machine. Sorry to interrupt, I thought you had some real uses
for your computer.

>play frogger. And 3D work is hard, too hard for Atari users anyway so why add

Who cares, in ten years our Ataris will still be running like
champions, accomplishing what needs to be accomplished. Whereas yours
will be obsolete in approximately eight hours, forcing you to upgrade
yet again.

That's funny, I coulda sworn that I swiped some DOS
software from the PC's in the German department so
that I could run it at home on my ST...

That would be a driver issue, actually... an
entirely separate matter. At least we could
attach them.

...and SCSI peripherals were more than attachable
to an ST. What the ST did have in the way of a busport
was more than adequate for the task and only required
a host adapter (much like a PC would).

Why? Because if you don't need professional color correction
it rather trumps the DOS boxen in interface and the Mac
boxen in price and OS overhead.

Macs used to sell for more than new cars.

Don't let that worry you. For three reasons.

1. I'm a pretty good judge of whether something is a personal attack or just general commentary.
2. I'm from NYC, and I was a sailor for 15 years, I'm pretty thick-skinned.
3. Knowing that you don't like Ataris, and that you think bloatware is fine, I realise that you must just be addled anyway :-)

>> What a concept. In the same sentence you say both that it wasn't
>> compatible with anything and that it used the stupid DOS filesystem.
>
>You couldn't run DOS applications. You were just stuck with the stupid file

Didn't need to run DOS applications. I had perfectly suitable apps on
my own computer. I did, however, need to transfer data and that is
where the file system compatibility was useful, plus the fact that so
many apps were able to save the data in a format that PC or Mac apps
understood - of course, for the Mac you had to find alternative
methods due to that GCR encoding.

>> From the very beginning I could use any peripheral that I wanted.
>
>Not SCSI peripherals, you couldn't. And getting printer drivers was a problem

No, not SCSI. ACSI was close, but not exact. Not that SCSI was such
a big standard in 1985 anyway. There was still no shortage of
peripherals though. I never had any problems with printer drivers.
The only ones that might have presented a problem at the time were the
color printers. I owned two color printers back then. A Star and an
Okidata. Both had Atari drivers.

Sorry, that doesn't wash. All Apple did was restrict people with their file system and set themselves up for a niche market. GCR? MFS? HD20? Guaranteed to fry hard disks. HFS was an improvement, but no great step forward. This is not to say that in essence it wasn't a better idea for a file system. But let's not talk about not being smart enough to make your own file system. Unless it was Apples intention to make a file system that routinely fried peoples hard disks and made their disks totally unusable by any other computer in the world. And even with all of the ravaged hard disks, I pity the people that couldn't afford to buy a HD for their Macintoshes. They weren't computer users, they were 'carbon-based disk exchange mechanisms.' No. Apple can hardly be called 'smart' for something like this.

Hey, I'm no big defender of TOS. It was based on CP/M 68K. But it did the job that needed to be done. The GUI overlay, GEM showed great promise, and worked across platforms, until Apple, who had done "a good job stealing the ideas of others" (Namely PARC, and the Xerox Star) decided that for some reason that since they had effectively stolen it that they should sue whoever else tried to come up with a GUI. This pretty much convinced Digital Research not to pursue the project any longer.

Fine. If you want it use it. I can generate any three dimensional, textured object I want, when I need it for what I am working on. I reiterate, however, that real-time 3D is a waste. Period. Not too complicated. Not too expensive. Just a waste of processor cycles.

>

>Sure, using your Atari, you can access a small subset of the content available

That's fine Brian. But where does it go from there? How many months before you find you can't run the newer applications until you feed more money into your machine? Karen and I use our TT online constantly for research. It does what we need. Why do I need to have shockwave? So I can put a little magnetic beard on a cartoon face? Java to play a tic-tac-toe game? RealVideo so I can watch a jerky picture that I've already seen on television in most cases? RealAudio in case I stumble across someones softcore site? And so on. Most of those are worth maybe 10 seconds of my time. Why go for virtual reality when I've got reality right outside my door - and an unlimited imagination? We've been to a total of about 6 places where we really needed to be but couldn't go due to the 'limitations' of our TT. Did we rush out and Spend >$1,000 on a PC or Mac? Sorry, we just ambled on over to the local internet cafe and visited them for $1.50. In my interpretation, that is not a "small subset" - and everything you mention is applicable to the web. You really shouldn't imply that it applies to all of the internet.

Terry

Only a technically challenged company like Microsoft would think of implementing a consumer operating system with 8.3, no case-sensitivity and no case-preserving file names. And only a stupid company like Atari would copy them.

> Yup, Apple was being real innovative there. As long as you consider
> stealing Xerox Palo Alto Research Centers Ideas part and parcel and

Apple bought the Xerox technology in exchange for stock. The then proceeded to define most of the user interface elements that are still in use today: menu bars, check boxes, radio buttons, etc. They were annoyed when Microsoft tried to use those same elements in Windows. Of course, they didn't worry about Atari because they knew that Atari wasn't good enough at copying for it to be a problem.

> Atari wasn't shouting "Me too!" Atari had an innovative system

Entering the game late certainly allows you to add a few features. Of course, Atari was good at finding the worst in everything.

> Wow... I wouldn't talk too loud then. Apparently Atari users a quite

We all feel sorry for Atari users. It wouldn't be fair if we excluded them just because they picked a crappy computer system.

Some of use aren't totally focused on games. We use 3D software, such as SoftImage, to get real work done. I just thought that explaining that would make it too difficult for the average Atari user to understand.

> Who cares, in ten years our Ataris will still be running like

If you want to do cutting edge things then you need cutting edge software and hardware.

The Top 10 Surprises About Apple's New iMac Computer

10. Free "Gullible Consumer" button with every purchase.

9. It only costs twice as much as a 233 MHz Pentium II, yet it will run almost 29% as much software!

8. Includes "Robert Downey, Jr. Mode" for energy-saving auto shut-off.

7. Decided not to go with the original "Bill Gates gave us a ton of dough and here's what we came up with" marketing campaign.

6. Special "Presidential" version: the iMacDaddy.

5. Still "insanely great," but now with 300% more insane!

4. Makes a Grande Skinny Latte like nobody's business.

3. Trash can icon lined with Apple stock certificate icons.

2. Due to miscommunication with design team, the first prototype was called the IMAX and featured a 100-foot high monitor.

And Top5's Number 1 Surprise About Apple's New iMac Computer...

1. Design team responsible for "new look" signed the inside of the case -- in Braille.

A program interuption to bring this note to Daniel's attention about previous notions of lack of Apple retailers..

Apple Canada Announces Hartco's Renewed Commitment to Sell Apple Products

Compucentre, MicroAge, CompuSmarts, and CompuSmart Networks to Showcase New iMac

MARKHAM, Ontario -- August 13, 1998 Apple Canada and Hartco Enterprises today announced that Apple's exciting new iMac product will be launched in its networks of computer resellers across Canada. Hartco is the master franchisor for 54 Compucentre stores, 75 MicroAge branches, and 14 CompuSmart stores located across Canada.

"Hartco's national presence enables Apple to substantially increase the retail exposure for the iMac in Canada and provide our customers with an opportunity to "test drive" and purchase an iMac when it becomes available on August 15, 1998" said Wendy Hayes, Vice President , sales, Apple Canada.

Compucentre, MicroAge, and CompuSmart will aggressively promote the iMac in all retail locations and will prominently feature the iMac with in-store displays and demonstrations. The locations will also offer a range of Universal Serial Bus (USB) peripheral products that support the iMac. The iMac uses USB to communicate with add-on devices such as writable disk drives, printers, scanners, cameras and game controllers.

"We're delighted to strengthen our partnership with Apple to deliver the iMac to customers through our national retail chain," said Jeffrey Hart, Executive Vice President of Hartco. "Based on consumer reaction to-date, we believe the iMac will be a phenomenally successful product and anticipate strong consumer demand for the product."

A complete internet-age computer right out of the box, Apple's iMac combines the excitement of the internet with the simplicity of the Macintosh. The iMac features:

A speedy PowerPC G3 microprocessor running at 233MHz with a high speed 512k backside L2 memory cache; Built-in 15-inch high quality display with 1024x768 resolution, 13.8-inch diagonal viewable image size; Easy connectivity - one button Internet access, internal 56Kbps modem, 10/100Base-Tx Ethernet, 12Mbps Universal Serial Bus (USB), and 4Mbps infrared port (IrDA); The world's easiest to use operating system, Mac OS 8.1, which runs thousands of Macintosh software titles; All housed in a stunning translucent enclosure that breaks new ground in industrial design.

iMac, which will ship with a 56K modem, will also come bundled with a variety of consumer software, including: AppleWorks (formerly ClarisWorks) productivity software; FaxSTF from STF Technologies, Inc.; Quicken Deluxe'98 from Intuit, Inc.; MetaCreation Corp's Kai's Photo Soap; MDK from Interplay Productions; Pangea Software's Nanosaur; Williams-Sonoma Guide to Good Cooking from Broderbund Software, Inc.; Microsoft Corp's Internet Explorer 4.01; Microsoft Outlook Express 4.01; and Earthlink, Inc's Total Access 2.01.

Hartco Enterprises Inc. is Canada's largest franchisor of computer integrators and retailers with 164 locations strategically located across the country, serving the business, government, professional and home markets. They operate under the names of "MicroAge", "Compucentre", "Northwest Digital" and "CompuSmart". In addition, the company owns and operates 61 department stores under the "Hart" and "Bargain Giant" banners in Quebec, Ontario and the Maritimes. Hartco also operates 22 "La Cabine Telephonique" and "The Telephone Booth" outlets in Quebec and Ontario. Company shares trade under the symbol "HTC" on the Toronto and Montreal Exchanges.

Apple Computer, Inc. ignited the personal computer revolution in the 1970s with the Apple II, and reinvented the personal computer in the 1980s with the Macintosh. Apple is now recommitted to its original mission - to bring the best personal computing products and support to students, educators, designers, scientists, engineers, businesspersons and consumers in over 140 countries around the world.

Apple Canada Inc. is headquartered in Markham, Ontario and is a wholly-owned subsidiary of Apple Computer, Inc. Apple products are available at more than 300 Authorized Apple Canada Dealer locations across Canada.

Apple Canada's home page on the World Wide Web: http://www.apple.ca/.

Apple, the Apple logo, and Macintosh are registered trademarks and iMac is a trademark of Apple Computer, Inc. Additional company and product names may be trademarks or registered trademarks of the individual companies and are respectfully acknowledged.

So you paid valuable money to buy an emulator to run DOS software more slowly than on a PC? That is impressive.

> That would be a driver issue, actually... an
> entirely separate matter. At least we could
> attach them.

If you can't get drivers for printer because you bought your computer from a backwater company then you should consider buying a different computer.

> Macs used to sell for more than new cars.

True enough. Ataris were as cheap as dirt and about as useful as dirt when performing computing tasks.

> So? How much does your T1 cost you?

I don't have a T1 at home. A lot of those technologies are pretty easy on your bandwidth.

You had access to a PC or Mac and didn't just use it?! I'm not sure that we have any basis for meaningful communication :-)

> Sorry, that doesn't wash. All Apple did was restrict people with
> their file system and set themselves up for a niche market.

Yeah. Forcing 8.3 file names, not allowing spaces and not preserving case was not restricting. Apple inovated to more the industry forward. Atari copied to hold it back. If Atari really thought that the DOS filesystem was a good idea then they should have made clones.

> The GUI overlay, GEM showed great

> project any longer.

Repeat after me "a good job of BUYING the ideas of others." They then went on to develop most of the UI elements that are still used in the industry today: such as the menu bar, radio buttons, check boxes, etc. Atari, OTOH, didn't come up with any good ideas and stole the worse of other people's ideas.

> Fine. If you want it use it. I can generate any three dimensional,

> complicated. Not too expensive. Just a waste of processor cycles.

Wrong, wrong, wrong and wrong. How do you preview and edit your scenes/animations before you do your final render? Do you see them in wire frame? In the world of fast computers, OTOH, you can preview your renderings in realtime with lighting effects and transparency. Even a $100 graphics card can gauraud shade and render a million polygons/s.

> That's fine Brian. But where does it go from there? How many months
> before you find you can't run the newer applications until you feed
> more money into your machine?

It totally depends on my need to run those applications. If I need to then I would probably buy a new computer. With the Atari, OTOH, you know that you will never get any processor intensive applications because they don't have much of a processor to begin with.

> Karen and I use our TT online

No, what does real audio or real video have to do with the Web? The web is
just a convenient way of accessing the files.

[Snipped Apple Canada's press release about Hartco's iMac policy]

Kind of makes you wish you could travel back in time to read Ford's
press releases about the Edsel.

>Now back to the scheduled programming of flamming. Keep it up Brian,
>Terry(wife too), Jedi and of course you 'chunks'

Just for clarification, any comments that appear in c.s.a.advocacy are
strictly my own. My wife enjoys our STs and TT and also has many
years experience with other operating systems. But she doesn't post
to this newsgroup, which is why I always sign.

I personally don't see it as flaming. Civilized observations from
various opposing viewpoints. If you want to see some flaming, check
out some of my posts in the more politically-oriented newsgroups :).

I like Apple. I wish them all the luck in the world. But that
doesn't stop me from pointing out perceived problems and fallacies or
inconsistencies in other peoples posts. I do the same thing with
Atari posts.

One button internet access huh? Gee, I'm sooooo confused. Here we
have this group that has their real-time 3D.... something that has
been claimed to be too complicated for Atari users.... yet they can't
figure out how to log onto the internet by themselves. Just another
example of our buddies over there deciding for themselves where you
want to go today

now HERE's an interesting bit of news - more interesting than the mindless posting of Apple press releases TIFKAS (The Idiot Forever Known As Sinclap) hides behind.....

in a REUTERS news article, a poll was taken by Computerware, a company carrying the "revolutionary" iMac. In it, 500 customers who had bought the new Apple wondertoy were asked regarding their computing background.

Of them, 15% (75 buyers) said that they were first time users buying their first computer.

13% (65 buyers) said that they were switching over from Windows to the iMac.

This leaves a whopping 72% (360)of these iMac buyers as existing Mac users. Gee, with numbers this impressive, Apple should be increasing their market share in no time :) However, there are a limited number of fanboys, so what'll happen when they all buy them.

Wanna check these figures for yourself? Check out the article at http://www.cnn.com in their Sci-Tech section - and also read about how iMac users are having difficulty connecting to the web...

TIFKAS is obviously clutching at straws to the point that rather than face the issues he directs insults at people about their supposed physical appearance. For the record, I'm 5' 8" and 200 lbs, and I unload trucks as part of my job description, so a good part of that weight is solid muscle; I also regularly cycle 20 miles round trip to work. And I can diet. For TIFKAS, however, getting the fat out of his head is a more delicate matter (I guess the liposuction backfired)....

>

HAHAHAHAHAHAHAHAHAHAHAHAHAHAHA!

Is that the best that Apple can do, TIFKAS - getting the iMac into COMPUCENTRE?

For the record, Compucentre is perhaps the most CLUELESS computer store chain in Canada. Tons of outdated software, unattentive staff and poorly maintained stores. And computers just sitting there unattended. Even when they used to carry Apple, their promotion of it as well as their knowledge of the product was woefully inadequate. And the number of stores have been shrinking over the last five years.

To REALLY sell the iMac, Apple should be targeting the shops like FutureShop, The Brick, Adventure Electronics, Bad Boy. However, what with Apple's treatment/disdain of their dealers (FS and Adventure used to carry Apple), these companies wouldn't touch the iMac with a snail fork.

Gee, 132 stores to sell an overhyped, overpriced, underfeatured appliance in a sovereign country of at least 40 million people. Is that the best Apple can do?

>
>Peter S.
>
>"The iMac has been the biggest computer launch we've seen in
>our history. Apple is back, and iMacs are flying off CompUSA store shelves
>across the United States."
>James Halpin, president and chief executive officer of CompUSA

too bad 72% of those sales have been going to existing Mac users (see http://www.cnn.com in their sci-tech section for a report from REUTERS on this - a more reliable source than TIFKAS, whose own demeanor suggests someone whose mommy still has to cut his meat for him). Too bad too that Apple has been pretty tight-lipped about how many iMacs they've actually sold rather than shipped pre-ordered......

You're not, and I did. Some of us know how to use our resources and

don't wait for the advertising gurus in Redmond and Cupertino to tell
us it's alright to do something now as long as we buy this months box.

>

I notice, significantly, that the major thrust of the section was
conveniently ignored. However, what's your point? That everyone
should have broken into little clusters where no one could communicate
with anyone else? That's absolute idiocy. I can pick up radio
signals today with a seventy year old radio. Does that mean that
technology hasn't advanced?   And as far as being a great innovator by
using long file names - sorry to disillusion you, but I was using long
file names on my Convergent Technologies C3 system and Wang word
processor long before the thought of the Lisa had even occurred to Woz
or Jobs.
[snipped]

Stolen. You buy the ideas of others and then try to convince the
world that they were yours, it's theft. As far as menu bars, radio
buttons, check boxes etc. go you are just (I have no idea whether it
is consciously or you just really don't know) perpetuating another
Apple fostered myth designed to delude the gullible, uninformed or
uninterested. All of these features were available on government,
university and industrial CAD/CAM programs as long ago as the early
seventies. The fact that they were only available on an application
by application basis and that Apple stole the ideas for use
system-wide does not make it any less of a theft. Perhaps you don't
like hearing the words stolen or theft - guess what? I don't like
hearing the word innovative for ideas that Apple did not originate.

Yes, and don't the bean counters love it when you do. I'll ignore the
comment about the Atari since I happen to know what my machine is
capable of and you're guessing.

I don't need to do that online. I can download the files and view
them at my leisure. And yes, we can view them.

Actually, you have absolutely no idea of how limited or complex my/our
needs are. You also have no real sense of what is out there since you
seem to be concentrating on the bandwidth-wasting doodads. I have
access to any computer I want. My TT does 99.7% - what could be
simpler than that?

Right. So what's your point? Stop on over to a local Atari users
house and let them show you how they can access all of these files
that you seem to think are outside the domain of Ataridom. Until you
do though, you should tread a little more gently with all-encompassing
statements. They will eventually make you seem quite uninformed, as
opposed to your current status as an honorable Mac/PC proponent with a
differing view of Ataris.

     It wasn't the present that was under discussion.

     However, it was nice how your conveniently deleted that
     rather trivial bit of my post (in terms of size) that
     referenced the cost of Apple computers for the point in
     time the comparision was being made.

     It's so nice of Apple to FINALLY release computers 'kinda'
     accessable to the bulk of consumers now that the PC cloners
     have already done it and catapulted Billy into his position
     of dominance while doing it...

     My bandwidth is half of a T1. Mind you, I'm somewhat atypical
     and I realize that. I was playing with digitized audio & video
     10 years ago so clogging up one's network pipe with it doesn't
     quite impress me as you might expect.

Isn't that personality, then?
How would an ST be a regular PC, when it doesn't match it either hardware-
software or case-wise?

>And then there was TOS. It was the worst of all operating systems. It wasn't
>compatible with anything, used the stupid DOS filesystem and the GUI was so
>disgusting that you felt like using CP/M.

The MacOS wasn't compatible with anything. GEM was at least compatible with
FAT (Although I don't count that as a good point).
The Mac GUI wasn't any better-looking at the time, either.

>Of course, things have changed. Atari's are now using processors that are

>the Internet.

The InterNet has not bypassed the Atari users. Many users post to the csa
newsgroups using NEWSie or other newsreaders.
The processors of watches are pathetic in comparison to even the slowest of
all Atari processors. The 68060 is not a bad processor at all, and can handle
both 3D graphics and InterNet.
Besides, an OS that is half as good as BeOS or OpenStep, is far better than
the MacOS.

The DOS UI was non-existant at the time. Who in the world would want to run DOS?
Just like Apple brought the GUI from the lofty heights of Xerox and the STAR, Atari brought the GUI to average people, even poor people, students and schoolchildren. I suppose you think that computing is only for the rich dandies who can afford expensive furniture such as the trendy Apple.

I have never wished to participate in any cool real-time conferences. It seems quite useless with bandwidth constraints, poor audio quality and special programs.

3D games have been available for the Atari since it was first released. Most flight sims were in 3D, along with Elite II and a host of others. How about 3D Construction Set or Persistance of Vision?

DHTML, Javascript and Java are all unnecessary, untested features for idiots to try out on their web pages, along with the <BLINK> tags and MIDI background melodies. I do hope for CSS support soon, though.

    hi Ron,

    actually, Brian's pretty good, and he does give good argument. In
fact, he started all this admittedly tongue in cheek a few  posts ago.
I'm sure that like all good debaters, he has at least some real respect
for rational Atari users, like I have for rational Mac users. I've
conceded to him on some points in the past, and even he's admitted
some of my  points have merit.

    Besides, any Mac user who agrees with me that Sinclap is a
disturbed little punk who really needs a life is ace in my book :)

    BTW, Brian, I missed your original reply to me from a few days ago
- for some reason, Idirect only keeps the contents of c.s.a.a for a
day, and I missed logging on the day you replied. I'd like a chance to
reply to your arguments direct :)

I'll add my vote to that.  As much as I've been going back and forth
with Brian, I understand perfectly what he is trying to say and both
enjoy & respect his comments.  Besides, I like the Mac.  Can't abide
universal cover-everything observations, that's all :)

>
>Nice try chunks. You have no case...

oh I think I do. I had enough of a case when cedarnet.org reprimanded you for posting MCIBTYC drivel in comp.sys.atari.st (and I've got the letter to prove it, so don't try to rewrite history - the fact that you didn't post there again until you got onto Earthlink only strengthens the proof you WERE warned and reprimanded). I'll have enough of a case as well if you try slandering me again.

so now, defending pornography. I may have my disapreement with feminists,
but I don't refer to them as "whiners". Maybe TIFKAS, despite his claims to be
a "macho stud", is really afraid of women.

>> And no wonder you want to vote for Bill Clinton - you're now BOTH

>> on......
>
>Clinton is directly elected and can't be bounced except for treason.

hmmm, I remember in my history books that Andrew Johnson was targetted for
impeachment because some senators didn't like the fact that he didn't want to
harshly punish the South as they wanted. And IIRC, wasn't the argument for
Nixon being impeached involved his lying, covering up, destroying evidence, and
conspiracy to commit a felony. Neither one involved a charge of treason. But
then again, that's what I expect of a Nixonian idiot despite your sheepskin....

I am
>disapointed that its gone this far that could of been settled last January.
>Its come down to this that the special prosecutor found no wrong doing in
>WhiteWater but wants to nail him for dropping his pants for pleasure after
>days of work grind. Whats next?

I believe that conspiracy to mislead a grand jury is also a felony, is it
not? That's probably the whole focus of Ken Starr's current investigation -
whether he instructed or cajoled Monica about lying about their relationship.

>Don't tou wish to be a macho stud, chunks?

nope. You can have your bimbos - I'm looking for a real woman with a brain,
like Bonnie Raitt.

BTW, I hope you're at least using protection - wouldn't want to see you die in five years from some of those terrible diseases going around :)

The only "chunks" you should be concerned about are the ones you blow all over this forum.....

>Your're complaining.. A great indicator that the imac is drawing new users..

nope, just the facts, m'am (a concept you are foreign to). Since when are existing Mac owners "new users"? In order to increase the market share, Apple has to sell to other than "new users". And since there are a finite number of Mac fanboys, expect to see those numbers of initial sales to go down - WAYYYY down - as time goes on. You really are Dr. Spin, TIFKAS - maybe you should be Bill Clinton's speech writer :)

then why didn't you report this supposed "good news" to comp.sys.atari.advocacy THE DAY IT WAS PUBLISHED, weinerhead - or were you trying to concoct another one of your dismissive disinformation campaigns which consist of mindlesly parrotting Apple press releases? BTW, I'd like to hear your take on the problems people are having getting their iMacs onto ISPs that was reported in the same article - or are you going to conveniently ignore that?

>
>Pot Kettle Black..So you're a laborer?

ah, another lame TIFKAS insult. Since when has it been a shame to be a labourer? They happen to be the backbone of any consumer-driven economy, and are responsible for buying many consumer goods - including computers. Which means they help provide your wages, pinhead. And I would love to see what would happen if you tried using that elitist attitude on a steel worker to his face rather than hiding behind a computer screen. (Me, I would just laugh in it).

Fact is, unloading trucks is part of the job description. I'm involved in sales and service in the hardware industry, which includes mixing paint, pricing, restocking, graphics design, advising customers, key making, and handling customer relations. I'm also responsible for the electrical, tool and automotive sections. What I make allows me to live very comfortably (I've always been frugal) - I've bought a nice new cruiser bike to get around town on, I bought a nice used laptop (Apple, it's a nice little computer), and I'm going to the CNE today and spend my brains out :)

Face it, TIFKAS - your little screeds are as pathetic as Eric Cartman's infamous "beefcake" speech. Let's hope your mom bought you lots of Cheezy Poofs to snack on....

  I do believe Daniel is right. Andrew Johnson took over the presidency when
  Abraham Lincoln was assasinated, and wished to continue Lincolns' policy
  of leniancy towards the South. Of course, members of Congress disagreed,
  and wanted to make it just as hard on the South as possible. It did actually
  come to a vote on the impeachment issue, and failed by only 1 vote. It was
  that close. AFAIK, Johnson was the only President to have impeachment
  proceedings actually go to a vote...

  History 101 is now recessed... ;-)

Do a search on his profile in Dejanews. The predominate posts by him involve harrassing fans of the company once known as Atari, and its products. He uses his Mac tyrades to try to one up people or something.

I am curious... anyone know if he actually has a life? I am surprised anyone would continue, at this time, to bash the Jaguar, which is no longer on shelves, but Peter Sinclair insists on this.

Now, do I have a life. That IS a good question. I am on Dejanews, decided to see if there was anymore Battlesphere news in the Atari newsgroup, and I find Peter still flaming away.

To think the whole Battlecruiser 3000AD flamewars on the comp.sys.ibm.pc.games.strategic newsgroup have stopped before Peter has. What a concept!

- Richard Hutnik

The PC, it may be slow, it may be kludgy, but I can get one made off the shelf the way I like it, and at least I can get a good amount of software. Also, it allows me to have a system without it becoming a religion, unlike what the Mac has done to Peter Sinclair.

Whatever people may see in the current situation the fact remains that
the statute empowers the special prosecutor to look into a specific
allegedly criminal activity.  Mr. Starr still calls his investigation
the "Whitewater investigation".  Without the backing of a congress
controlled by the opposing party there is no way that this
investigation leagally should have left the confines of a failed
twenty-year-old business deal.  No Travelgate (how ridiculous, all
administrations bring in their own people).  No Filegate (Chief
Executive by definition has access to records of an Executive branch,
especially when they're stored in the White House).  The death of
Vince Foster.  Aiding in the Paula Jones case (one of the first
lawyers to volunteer, and afterward provided all of his advice for
free).  And investigating whether or not Monica Lewinski gave
President Clinton a hand or blow job.  Whether or not Mr. Clinton was
wrong in what he did, it should have never seen the light of day in
```

this venue.

Some little known facts are that:

- If Mr. Bush had remained president, Mr. Starr was to be recommended for a Supreme Court position.

- Mr. Starr is and always has been a tobacco company lawyer and what better way to brunt the thrust of a percieved anti-tobacco president (and yes, I am a smoker).

- Mr. Starr, within three days of being appointed Special Prosecutor indulged himself in a little conflict-of-interest. His Kirkland & Ellis law firm, from which he did not severe ties was being sued by the RTC (Resolution Trust Corporation) for its connection to a failed bank. Within three days of being appointed, Starr started using his unparalleled powers as a special prosectutor to begin investigating the activities of the same RTC officials who were involved in the decision to sue his law firm. Starr's law firm settled out of court in January of 1996 for $325,000 -- $700,000 less than the RTC had predicted it could have gotten in a trial. Starr said that he did not know about the case -- which the RTC filed in May of 1993 -- until October 1995, even though he served on the firm's management committee (yeah, his secretary forgot to tell him that there was a one million dollar lawsuit against his company).

- Mr. Starr, who claims he is only pursuing the matter to determine whether there was perjury or evidence of suborning perjury has already been found guilty of both. It has been proven that he not only deliberately leaked information about his investigation, and then not only lied to the court about it, he instructed his attorneys and investigators to lie about it also.

- Robert Fiske, the earlier Whitewater investigator was removed Republicans claimed that he had a conflict of interest because his law firm -- from whom he had taken a leave of absence -- had represented International Paper. When he as appointed Whitewater Independent Counsel, Kenneth Starr _represented_ International Paper, which had sold land to Whitewater Development Company. As stated earlier, Mr. Starr maintained his ties with Kirkland & Ellis.

Some things I don't like:

- Kenneth Starr earned over one million dollars from his private practice in 1995, while he was supposed to be dedicating himself with investigating Mr. Clinton.

- More than eighty million US dollars has been spent on investigating Whitewater over more than six years.   In fact, the FBI provided more resources to this investigation than to the World Trade Center bombing. When you spend this type of money, and use these unlimited resources, do you really think that it's

strange that they eventually found *something*????? What you
should really find strange that that the only wrongdoing that the
president has been found to have engaged in was getting a little
on the side.

I am not saying that your belief that he is "a turkey and should do
the right thing and resign" is wrong. It's your opinion and just as
valid as mine. But I agree with him that this was politically
motivated and it was none of their business. I don't ask the grocery
clerk if they are an adulterer and if I find that they are put my
groceries back and shop elsewhere. And I certainly wouldn't ask the
fireman that came to my flaming house whether they committed adultery
and if they have tell them to just go on back to the station.

OK, I've vented in an entirely inappropriate area. I apologise and
promise that I won't continue this, period.

Terry

so, TIFKAS (the Idiot Forever Known As Sinclap) DOES inhabit other forums
other than the atari forums? Interesting. It's also interesting that he
actually rarely posts to the mac newsgroups - last I saw him there he was
harassing someone who dared point out the flaws in the iMac with a sketch
about a middle-aged couple seeing the flaws and going to see the PCs;
TIFKAS sneered that "who would name anybody Martha - let all the Marthas own
Packard Bells!" (this can ALSO be found on DejaNews, TIFKAS, so don't try to
rewrite history again)

     he CLAIMS to have a life - lots of money, flashy car, he's breeding like a
     bunny. Unfortunately, he uses this song-and-dance every time he wishes to
     dodge the issues - that and making snide, elitist remarks to anyone who
     dares to contradict him. My take is that he's no better off a working stiff
     than any of us, and is in  constant fear of losing his job. His utter idiocy
     (to the point that he makes up facts about Ataris, like claiming that  "90%
     of all TOS applications fall over on the Milan", and "for the cost of a
     Nemesis board you can buy a UMAX Mac clone <NOT a typo>", and "Ataris have
     inadequate Internet clients" - not to mention claiming that Canada is the
     51st State) certainly doesn't help.
>

The Amiga made the Mac and Atari appear second-rate.
The Mac had a shit OS, and the Atari's capabilties were too limited.

The Amiga was simply the best home system available until 1994, no doubt
about it.
It too was a lot cheaper then the Mac, and far more capable.
Mac OS still sucks in comparison to Amiga OS.

I forgot, to much work on my mind like planning for the reopening of the new
Comp store in Arlington, whether I will have enough Mac inventory on hand
etc..

As for ISP issues. Apple has isolated the login issues. Their answer is:
subscribe to earthlink. The cause is that many ISP's have not fully upgraded
to the 56k V.90 standard.

I just asked you a question. Again you have a reading comprehensive defect.
I was a laborer at one time in College. My job description included trouble
shoot all these wintel computers in the library and special assistant to the
Library Director which involved in delivering papers and cooerespondence to
other dept across campus. At least I had plenty of outdoor adventures with
lots of physical exercise. During the time when the library was going through
rennovations from top to bottom that included the addition of the fourth
floor, wiring network nodes was a bitch but we got it done.

Yea soo. Apple lost more than that and they are back. CompUSA will be a $10
billion retailer by 2000.

Peter S.

  Creative Computers' MacMall Reports Record $4 Million in iMac Orders;
Demand From PC Owners Drives Expanded Exposure for iMac 08:05 a.m. Aug 24,

1998 Eastern

TORRANCE, Calif.--(BUSINESS WIRE)-- Aug. 24, 1998--Creative Computers, Inc. ("Creative") (Nasdaq: MALL) today announced that its MacMall division, a major cataloger and Internet provider of Mac products, reported a record $4 million in orders of Apple Computer Inc.'s ("Apple")(Nasdaq: AAPL) iMac as the company continues to take orders into the second week of the product launch. The sales represent the Company's largest ever dollar volume for a computer at launch.

Additionally, the Company reports that it has received so much interest in iMac from its PC customers that it will expand its exposure for iMac by advertising it in its PC Mall and ComputAbility catalogs.

"We expected it to be big, but consumer interest in iMac is bigger than big," said Dan DeVries, executive vice president of Sales and Marketing of Creative, which owns and operates MacMall. "Our CEO, Frank Khulusi, and I are both so excited about iMac that we each bought one for our families."

"Orders for drives, USB scanners, printers, connection devices and software have also been fantastic," added DeVries. MacMall offers a complete selection of iMac peripherals.

"We're shipping iMac every day in response to the incredible consumer demand for our newest computer," said Mitch Mandich, Apple's senior vice president of Worldwide Sales. "As Apple's second largest cataloger, Creative is a key part of our channel, and has helped fuel the intense consumer demand for iMac. We're delighted that it's helping us attract Mac owners, as well as first-time buyers and PC customers, by featuring iMac in all its catalogs."

MacMall was the first Apple reseller to offer 32 MB of extra RAM with every iMac purchased, as well as up to $675 of discounts on products purchased with it. The Company has established a special Internet site -- http://www.macmall.com/imac -- to help handle consumer demand for ordering iMac.

I got into Eartlink due to my transfer to Dallas, Texas from Cedar Falls, Iowa. Cedarnet.org is not available in Texas. Also, Cedarnet's usenet capabilities only extended a mile and doubt you could of read my posts. At least the email was free. I did recieve a letter concerning a complaint by you..However, you're whining was refuted..You should stop the personal name calling in your replies to me because it makes you look like an idiot when you whine to ISP's.

He got impeached because he fired the Secretary of Defense(Secretary of War in
those days) who was insubordinated.

It's exactly what I said..He can't be bounced except for treason cause he did
not committ a felony.

What grandjury did he misled? The Paula Jones civil suit was thrown out
before it reached a courtroom.   Starr will never prove Clinton tried to
influence Monica. Give me a break...This shows that Starr is grasping for
straws and that WhiteWater, Travelgate, filegate and any other gate you want
to ad have come up empty..

OK, THIS will be my last post. Just realised I didn't include any sources.

Resolution Trust Corporation: _The Nation_ 3/18/96,
                               New Yorker 4/22/96

Leaked information: Recent news articles.
                    New Yorker 4/22/96

International Paper: _New Yorker_ 4/22/96

And more, but they're misplaced at the moment. And here's one more quoted article that is interesting in light of his investigation of Whitewater. (_The Consortium_ 3/28/96; _In These Times_ 4/29/96)

Starr Refuses to Detail Early 80s Real Estate Deal

Kenneth Starr refuses to provide details of an investment in the Lubbock AK LTD real estate partnership, which he made in the early 1980s. All that is known about the investment is that Starr never claimed on his tax returns the @20,000 he says he lost on what was described as "a start up exploratory fund for possible acquisition of property" in Texas. Circumstantial evidence suggests that the AK initials in the investment could stand for Iran-contra arms dealer Adnan Khashoggi, who was involved in Texas real estate development in the early '80s.

Geeee.... where does Whitewater end & Lubbock AK LTD begin. Sheesh.

& As far as a person just realising that a President is a fibber - how do you think he got into office in the first place?   Simply too many groups, going after too many divergent goals for a politician of _any_ party to hope to get elected without telling fibs.

<slap> Shut Up Terry! This is comp.sys.atari.advocacy! -- OK, I promise... I did really only want to give the sources <grin>

Terry

>utility would the floppy have for me? None.

Actually, I've never disagreed with that. From the sound of it, it
will work fine for you. I just disagree with the mass appeal that the
concept will have. I know for a fact that too many people use
floppies.

[snipped]

>1) Less than 5% of my hard drive is used by applications. The rest is for data

>so "bloated" applications aren't adding much to my storage requirements.

That is a valid point, however, so is mine. The applications themselves, when used by people that know just enough to be dangerous, generate gargantuan data files. Here is an example of a situation I straightened out last year:

A department handles all of the outgoing shipments that are not related to our finished product. They use, at various times, three forms:
a - Packing Slip (100%)
b - Shipping notice (maybe 1 in 15 times)
c - Bill of lading (maybe 1 in 25 times)
Total unique text on these three forms is approximately 2000 bytes, most of which is on the bill of lading, which is rarely used.

They were using Excel as a forms generator - Basically, they were putting in dates, charge codes, quantity, item identification and authorizer - somewhere in the range of about 120 bytes worth of information. This workbook contained worksheets for all three forms, an address book that they started, but only got around to adding about 30 names to, a scanned company logo and a scanned signature. Both monochrome images, destined for a monochrome printer, were scanned in color then imported into Excel on all three sheets, and then reduced to the proper size. The images were then saved with the workbook. Total file size was 362 kilobytes.

They then took this basic workbook and duplicated it, changing nothing but the vendor name and address and the filename, for each vendor that they shipped to. They ended up having 1,178 files.

Almost half-a-gigabyte (362 * 1024 * 1178 = 436,670,464 bytes). All of this for 3K worth of text, two <4K (scanned in mono, clipped, reduced & saved compressed) images and maybe a 40K address file. It could have been worse though, since we have close to ten thousand activwe vendors at my mill.

>
>2) What bloated applications does Apple ship or foist us with?

I don't need to answer this, just look at your own hard disk. I'm not referring specifically to Apple or Microsoft applications software (although they're guilty) but of the software that the operating systems have engendered. Think for a while what a spreadsheet (for example) is supposed to do, and how large such a program should be. Then look at the size of your spreadsheet, all of its resource and auxilliary files, help files, and everything else it needs to run and see what the comparison is.

The reason that they did something as foolish as I mentioned above is because they could. They saw that Excel was trying to be a

spreadsheet, word processor, graphics program, data-base, programming
language, multimedia display system and everything else. Of course,
then you go over to the word processor, and find that it tries to be
all of those things too... just with a little more emphasis on the
word-processing aspect. I could go on, but I won't.

>3) Your data requirements are pretty light. I need about 70MB just to transfer
>my source code to work. Even a typical (1024x768x3) uncompressed screen snap
>won't fit on a floppy.

My data requirements vary. I don't use drive my Winnebago to the
corner to pick up a package of cigarettes, I walk. I do, however, use
it to go camping.
>
>4) Why don't you use your LAN at work for data exchange?
I do use my LAN at work, all the time. I also find numerous uses for
floppies.

I agree. However, the discussion was whether or not people use
floppies, not whether there were more efficient ways of accomplishing
a specific task. No matter how poor (or overly-complicated, though
sophisticated) the the LAN design is, or how stupid the management
policies are, the fact remains that they apply to 1,200 people in my
mill alone, so people have to find alternate procedures. And,
all-things-considered, it is _highly_ unlikely that my mill is unique,
or even an exception. Also, those were just a couple of examples I
tossed off before heading to work, there are plenty more.

Pardon? Am I the only one who doesn't use my computer in a total vacuum? Am I
the only one who needs to transfer files to other computers? Am I the only one
without an ethernet connection to every other computer in the world?
The floppy may be dead, but Apple has taken no steps to offer any
alternative.

Floppies may be slow, small and irritating, but they are virtually everywhere!
What other method do you recommend for transferring data? Keep in mind that
the CD drive in the iMac is read-only.

Exactly. Why not give the user that freedom of choice as well? Why not make a
totally stripped computer, consisting only of a screen and motherboard,
allowing the user to choose exactly what accessories he wants?

>A local vendor that buys in bulk will be able to sell a peripheral for
>the same as apple would be able to.

An internal, factory-fitted drive would probably be cheaper than one of these
new-fangled, external drives.

>downgrading from Win95 to Window 3.1, and see what happens)

Most software is available in Win 3.1 versions as well, which isn't very
surprising, with many corporate and home users still running Windows 3,
perhaps even more than those running MacOS.
Besides, how can MacOS have inflated eightfold within one version number?

>As for OS8 being current. Yes, it is. You can't get a more current OS for

Now, aren't we setting our standards a tad low?
It must be said that Windows has got some kind of multitasking nowadays,
though, a more advanced kind than that of the Mac.

>I don't know if Win95/98 supports pre-emptive multitasking or not. But it
>certainly crashes more often than MacOS 8 does. I have a friend that works

Both platforms crash for me. So does my Amiga and so does Atari. None is
particularly reliable. You just have to make sure to save your work regularly,
or you will be sorry one day. No system is infallible.

>As for your comment about the MacOS not even qualifying to be considered an
>OS... That's absurd. Without it, the machine would NOT operate. That alone
>means that it is an operating system. An operating system can be as simple
>as MS-DOS (even simpler, I suppose). But in the current day of the GUI, 8MB

I run a computer with a GUI, but my total memory doesn't even amount to 8 MB.
There are many definitions of an OS, and according to many, MacOS or MS-DOS
doesn't qualify as an OS.

Ethernet is quie useless for information exchange, unless you happen to be
hooked up via ethernet to every computer you need to share files with.
Ethernet is useful in a LAN environment, but how many of these first-time
buyers which are the supposed market for the iMac have LANs at home?

>> That is quite a lot for an operating system, even in our days of cheap RAM.

Of course. UNIX users will probably think that is ridiculously little.

I always carry at least one floppy, and the amount of floppies in the computer
facilities is a sure sign that many others find them useful.
Text files are very small, and I often have several on my disks for printout
and editing at school. When I visit friends, I bring files on floppies, and
they do the same when they visit me.
I do not have any LAN to dial into.
A floppy drive is such a basic peripheral, so I can understand that the Mac
designers forgot to add it in their hurry, we do take it for granted, after
all.

8-track has never been much of a standard. Compact discs, LPs and cassette
tapes have been, though, and still are. The same goes for floppy disks. I
wouldn't cry if the iMac designers left out a 3" floppy drive, but a standard
3,5" floppy drive is standard environment in every computer since 1990.

Quinlan, are you the intended target market for the iMac? Don't you think
first-time users will want to transfer files outside the LAN they are supposed
to have at home?

That's good for you. I put my measly kilobytes of code on DD floppies, since
that's all I and my school have in common.

>>     What I find funny is that the new student Mac (which I saw at my

The cost of a floppy isn't high, especially not when compared to its utility.

Of course. They should offer some sort of writable medium. Throwing out the
floppy without any replacement is plain silly.

That wasn't my point. Perhaps it's a good idea though. At least until
the consumer can get some software that isn't going to cause their
computer to lock up mysteriously, crash at least twice a day
(regularly scheduled crashes... now there's a truely unique offering),
and make your 333 megahertz Pentium II run about as fast as a 286 in a
brownout.

The operating system should protect your from application errors. Try running a UNIX variant or, if necessary, NT. Also, I have a PII and it feels very snappy to me. I can live with waiting 2 seconds for Word to load up.

That depends of your coffee maker. If you have one which can be programmed to start at a particular time then it may well have a microprocessor. But I'll give you another example, a car ABS system is microprocessor controlled but I'm fairly sure that it doesn't run an operating system. At KD Engineering, we make air quality data logging systems that are controlled by > 10,000LOC but they don't have an operating system.

Doesn't your school have dial-up access? A few kilobytes of source code should be transferable in under 10 seconds.

> The cost of a floppy isn't high, especially not when compared to its utility.

For some people, the floppy has zero utility. Apple is probably hoping that these people will be attracted to the iMac.

Ethernet or, worst case, the modem. Doesn't everyone have at least modem access at home and at work/school these days?

No. You don't need a LAN at home. You can use the built-in modem for
transfering small amounts of data. BTW, could you please call be Brian?
Quinlan has negative conotations for me.

What Mac software doesn't come on CD?

In what respected publication can I find this definition? The two most respected definitions (used by most reference works) of an operating system are the "resource manager" and "extended machine" definitions. DOS may not satisfy the former definition. The Mac OS, however, would be considered an operatings system by both definitions.

Just use the modem to connect to your ISP and you are set.

Brian and I were discussing bloated applications in the 'new iMac flaw - upgrade memory (etc.) thread and I decided to move it over here.

On Friday, August 14th at 4:25 GMT Brian said:

bq>So what are you arguing for? Component software architectures? Less capable
bq>software?

Upon reflection, maybe I am. It depends upon how you define capability. Just give me the tools I need to accomplish a specific task. I know how to load, run and use other programs. A full-fledged spelling and grammar checker and a complete drawing program (as opposed to a graphing routine) as an _integral_ component of my

/spreadsheet/? Yeah. Right. And I have an Oxford dictionary, Columbia Concise Encyclopedia, Rogets Thesaurus, Chicago Manual of Style and a fully equipped drafting table permanently affixed to the calculator on my desk --- with individual copies of this package attached to both my pen and my index file (you never know, after all).

Simply put, I don't got to a library expecting to be able to buy my groceries while the librarian is pulling my car into the reading room to repair my transmission. And, for the life of me, I simply can't remember the last time that I went to a travel agent to pay my telephone bill.

All of these layers upon layers upon layers simply bog the computer down and make it more susceptible to crashes. As I mentioned in another post: mysterious lock-ups, routine crashes, and sluggish speed. Tell me how long you would blithely ignor a videocassette reorder that always mysteriously stopped in the middle of recording or playback? Suddenly just died, routinely turning itself off whenever you tried to use it ---with a high probability that it would also eat your tape, fry your television, and somehow or other make your doorbell turn your bedroom lights on and off? To top it all off, when it wasn't doing all of this, it would only play your tapes at 1/3 speed (and then only if they had been recorded in a VCR made the same year). How Long? The strange thing is that this seems laughable to people - they would have that VCR back to the store within minutes. Yet they accept the same thing on their computer as a matter of choice, just calmly rebooting and waiting for the next crash. Sorry, but I know more than enough ways of making a computer crash - I don't need any automatic crash systems cluttering up my desk.

Component software architectures?  In my opinion that has become
merely an apologists bugaboo boy that is no longer faithful to its
original (valid) context.
```

There is nothing wrong with components or compartmentalization per se. Indeed, everyday life is replete with examples of where this is not only satisfactory, but a more effective approach.

Witness the capabilities of audio components when compared to even the best boom box. Compare a large format or 35mm SLR to a do-everything point and shoot camera.

Or even closer to home, consider your bathroom. How many people do you know that want to use this area to cook dinner? Now, I might want to read something while I'm using the bathroom, in which case I would "import" a book. I most certainly wouldn't spend money to buy or install a bathroom with a fully-stocked library, or facilities for printing my own book.

I have not countered an irate imac customer yet. The imac customers are over
joyed with their new buy. It's been an imac weekend at CompUSA.. I have read
that Computer City in CANADA sold out the imac...

Oh well...

They better or Imation will eat their lunch. Epson is eating HP's lunch when
an imac goes out the store.

ahh, the typical TIFKAS trait - if you run out of arguments, start an ad-hominen smear campaign against someone who is clearly winning the debate.

For the record, I have kissed a girl. As a matter of fact, I was nearly married (and the reasons why I didn't go through with the marriage is no concern of yours or anyone in this forum - this is a computer forum, after all). Currently I am dating no one, although my prospects are looking up with at least one woman who works in the same building as I.

I also don't live in my parents' basement - I live in somebody else's basement :) AAMoF, I'm currently looking after the house for my landlady.

I also don't make a habit of claiming that I'm a macho stud - in fact, I respect women and they respect me. Including feminists. You know, TIFKAS, the women who you're so afraid of that you make misogynist remarks about, just like your hero Rush Limbaugh.

Hopefully, TIFKAS will change his tune when the next woman who he tries to treat like an "inflatable" turns out to be a "bunny boiler" :)

yep, at least they'll be able to print in one month when the Epson printer comes out. And they'll be able to back up their files to the most popular removable media by January. But I guess drooling fanboys don't really think about those issues, do they .....

It's been an imac weekend at CompUSA.. I have read
>that Computer City in CANADA sold out the imac...

funny that Computer City's weekend flyer in the Toronto Star didn't mention anything about the iMac anywhere. We can thank InCompUSA for that one.....

CompUSA needs all the help they can get, seeing that they lost $50M in the last quarter (on top of that big loss they had on the previous quarter)....

Imation is apparently also in danger of "eating it" - hopefully they don't as their SuperDrive looks like it'll be the next peripheral I'll be adding to the ol' Falcon :)

Where's the rest of this damn thread? We can't all be expected to read
comp.sys.atari.advocacy in addition to the overwhelming multitude of posts
each day in this group, can we?

Can't imagine why - the iMac was priced here at $1,929 Canadian
dollarettes while the G3 was advertised at $2,125 with monitor - maybe
they only had 1 available - but why go for an iMac unloaded when you
could get a 'real' G3 for only 200 Canadian Pesos more ?

You have no idea as usual. Initialy, Iomega stated that the Zip would not be
available until November time frame but subject to change. My customers were
told of this with availability subject to change.

As usual...They can...with the current availabity of the Epson 600 USB adaptor
available since 8/15!

> quarter)....
>

```
Looks like Computer City needed help to...thats why Comp gobbled them
up...Looks like a charge will be needed.

CompUSa's current woes are softness of wintel sales in spring/summer and lower
average selling price.  The imac was their biggest selling computer ever over
one weekend..

>
>So your stalking this girl(?)..

my my. First with claiming I have a criminal record (which I don't) and then suggesting I would stalk women to ultimately harm them (which I wouldn't). As well as trying to claim I'm gay, which is a) not true in any case, and b) wouldn't matter even if I was (you know, I'm beginning to detect a bit of homosexual panic in Mr. TIFKAS' postings). No, this woman and I are having some nice conversations and we have mutual respect for each other, and I'm going to ask her out.

You know, spreading innuendo about a person is bad form (shows that you're running out of arguments), and could lead to some nasty repercussions later - like a nice letter to your ISP and my-dejanews about slander. I think we can start by starting to cross-post your replies to me to alt.usenet.kooks - it hasn't been the same since Earl Curley died, and they need someone to laugh at, and it might as well be you.

you started by making disparaging remarks about "whining" feminists and comparing them to Atari users. My, what a hypocrite. You claim to hate Rush and Republicans, and yet you use their same tactics, like referring to Atari users as "the Atari Jihad", referring to us as "boobs" and making up stuff about Atari and TOS up from whole cloth. My a nice plasticine mind you have. Unfortunately, the tactics aren't working, no matter what new tactics you use to weasel out of your situation.

Ironically enough, Al Franken shoots down all sorts of pompous asses in his work other than Rush - and you'd be a prime target for his satire. Maybe a nice psychiatric session with Stuart Smalley ("sorry, Peter, but Cleopatra isn't the only Queen of Denial").

And no wonder you want to vote for Bill Clinton - you're now BOTH known fibbers who should be immediately bounced from their jobs,(I heard Clinton's self-serving speech last night, and the turkey should do the right thing and resign). At least our Prime Minister keeps his pants on......

still claiming to be a macho stud. ah yes, everything's fine until you unexpectedly crash after one minute :)

I guess that TIFKAS hasn't seen "Fatal Attraction", otherwise he'd get "bunny boiler".

Hi Winguy - thought you might enjoy these little tidbits.......go to dash off now and add a few new links to my Mac Favorites page on the Web....

Tom

Apples tendency to shoot itself in the foot over QC/QA is already starting to surface with the iMac. The modem, mouse and CD Rom are turning out to be a little problematical. A few printing and software issues have also shown up.........the next week or so could be very interesting, and will tell us once and for all whether this "bet the store" machine is for real or another Apple fiasco........

From: http://macsupport.miningco.com/blcenter.htm

Don Russel reported just got the iMac home, everything great, except the CDrom. The three pins around the spindle don't retract upon opening the CD drawer.

snip

Shaun Opp reported I haven't been able to get Quake to recognize my mouse, perhaps because it's a USB device. I've tried the "+mtools" command line in the game which is supposed to let you aim with the mouse but no go. When you select the "Mouse/Joystick" radio button under options, it says you have no devices to configure. No reports yet on MacSofts website. Also placing pressure on the iMac CD tray results in my monitor blipping out similar to a degauss on a normal monitor.

Ken Glinka reported I am having a hard time connecting or staying connected to my ISP (Netcom). The iMac modem will connect and then it will hang when it tries to start PPP, then it tells me that the remote server is not responding and disconnects me. When I do connect I will either have no problems or get disconnected very quickly. I have talked to Netcom and they are not sure. I have everything setup like my Performa 6400/200 (PPP).

Jeff Rawlings reports I can't connect to aol w/ the imac modem. It keeps timing out on me. I've tried different/slower access #'s. I suspect aol and the new mac modem are having trouble talking. If this is a common problem, the imac is in big trouble right out of the box. Boy do i hate that. :((

From: http://www.macfixit.com/imac/

Imaging the ROM into RAM takes up 3 mb of precious RAM:

A minus: less RAM available Hardware-specific code that performs the computer's startup activities resides in firmware (ROM). That code fits into one ROM called the Boot ROM. All higher level software resides somewhere else, largely in RAM. This removes approximately 3 megabytes of RAM from Mac OS usage. In effect, a system with 32 megabytes of RAM appears to have only 29 megabytes available.

It's hard to get into:

Getting inside A Macworld review notes that getting inside the iMac is "hardly brain surgery, but it is dramatically more complicated than some of Apple's earlier designs for Performa and education-oriented systems." Meanwhile, iMac2Day's Visual Memory Upgrade Guide shows how to upgrade your iMac's RAM. An Apple TIL file covers similar ground.

From: http://www.macfixit.com/imac/imac-t1.shtml

Printer compatability issues

Epson Monitor3 memory Evan Matiatos had problems getting the new driver to work with his Epson printer and iMac, using the Epson USB / Parallel Adapter. Even turning off background printing (as suggested in the manual) did not work. He found that increasing the preferred memory size of the Epson Monitor3 file (located in the Extensions folder) from 1Mb to at least 2Mb did the trick. This worked on three iMacs.

Jeff Ashmann had similar printing problems with his 2 iMacs and Epson 600s. "It will print half a page, single lines, dashes, all kinds of garbage. We are unable to print anything usable."

and from the same page, multimedia problems:

Movie glitches? Flip Russell had problems with the playback of Cinepack compressed movies. For some reason, disabling the included AOL Scheduler startup item solved this problem. "I'm also getting 'not enough memory' errors from MoviePlayer when I try to play Sorenson compressed movies. Haven't found a workaround for that yet."

Quite a list for only 48 hours and a few thousand machines......time will tell!

Tom Elam

[time warp ON...]

Does anybody know of any desktop TV apps dating back to the early 80's?
I'm looking for something which would have displayed a TV program
schedule and allowed the user/viewer to select what to watch.

In particular, which of the early computers (TRS-80, Apple][, Atari,
Amiga...) was the first to provide such a capability?

Any info much appreciated!

I didn't claim such a thing...I just asked a question.

> situation.

Yep I have with good reason. Feminism is a genear term that can be defined
in so many ways or use it to hide behind it for agendas. There are some
scary feminish groups that are on par with the religious right republicans
who want to censor - what we read and view that may have percieved anti
family messages and visuals that may show women in a pornographic light.

> Ironically enough, Al Franken shoots down all sorts of pompous

Clinton is directly elected and can't be bounced except for treason. I am
disapointed that its gone this far that could of been settled last January.
Its come down to this that the special prosecutor found no wrong doing in

WhiteWater but wants to nail him for dropping his pants for pleasure after
days of work grind. Whats next?

I personaly think he should step aside so he can deal with this nonesense.
Lets face it, Clinton is a lameduck..The Gore administration should get a
head start.

The iMac. Apples newest household appliance. The latest Apple design will fit quite nicely next to your old Mac Plus, but adding a little color to your kitchen. Yes housewives, the latest technology is right at your finger tips. This little jewel will compliment most kitchen accessories that you just couldn't part with from the 50's. No need to worry about printers taking up space, or the kids wanting to play Doom while your baking your (sic) Apple pie in your kelm. The designers at Apple thought of these things for you and incorperated them into one single package which will look nice next to your blue gravel fish tank.

Really people, take a close look at this thing. It's an advertising joke. Only in America.

The best use of the iMacs will come when Back to the Future VIII is released. It will fit nicely next to the Mac Plus in the Antique dealers window.......... Looks like history does have a way of repeating itself.

Forever Known As Sinclap) wrote:

    < much personal attack lacking in computer debate snipped >

obviously, folks, there rests my case. Sinclap, realizing that he can't outshout me, intimidate me, or outthink me, has sadly been reduced to spreading innuendo about me. And quite lamely, too - after all, anybody who would think that being the vice-president of a computer club is something to be ashamed of obviously has some personal issues to deal with. Anyone who would try to take this into a forum completely unrelated to the issues at hand (as TIFKAS has when he took it to alt.nerd.obsessive and wound up posting his usual drivel and denials to it, thereby causing its denizens unnecessary wasted bandwidth that would've been put to better use as a get-rich-quick scheme posting) is in dire need of professional help.

TIFKAS, you have sunk to a new low. If you can't stick to the issues at hand which is the main thrust of this forum, then shut the hell up. And the issues are whether or not the iMac has merit as a computing platform, whether Atari is still a viable platform as we head to the year 2000, whether the Milan changes things regarding the future of the Atari platform. Not my weight, not my love life, and certainly not your overt attempts to smear me. All it is accomplishing for you is reinforcing you as the greatest laughingstock on the USENET today.

As Senator Barry Goldwater (the last great GOP politician) said to Dan Quayle while he and George Bush were on a similar smear campaign against Michael Dukakis in the 1988 US elections, "go back and start talking about the issues".

As for trying more personal attacks against me - I know of a good way to stop you that will make you look even more ridiculous. Does the term "Doe Snot" mean anything to you? 'Cause I'm prepared to use it now - and it's been proven very effective against loser trolls like you. Your next attack against me will use this technique......

Yeah right. Try to run those OSes with 8mb of RAM, as the original poster was claiming "real" OSes (like this TOS) should run on 8mb of HD space.

What degree? Blue screen? I don't see any sort of protection under Win95. In fact, I feel like I'm not protected at all under Win95, as it's such a confusion...

The MacOS is an operation system, no matter by how definition. Jeez... You know, even those clunky internet telephone things have operating systems. If you can't put that across your skull, then give up, the MacOS is as real as any other OS out there.

Sorry, I was listing good operating systems not good operating systems with small memory footprints.

> What degree? Blue screen? I don't see any sort of protection under

Win95 offers memory protection to win32 applications. The Mac OS offers no form of memory protection to any type of application. All applications work in a single address space.

> The MacOS is an operation system, no matter by how definition.

No offense, but you need to improve your reading comprehension skills. I was clearly defending the notion that the Mac OS is an operating system.

>

yep, and as usual using his same old techniques of outright lies, gross exaggeration and ignoring the real issues. Imagine that - ONE person posts he's selling off his Atari equipment, and TIFKAS immediately declares the entire Atari MIDI scene dead and buried - same as he claimed that "many Atari users can't get CAB working, so it's an inadequate web tool", when it was actually a handful (and many of them just needed to make minor adjustments - hypocritical when you find that TIFKAS posts his usual drivel with a news service that is rapidly being identified as a refuge for the computationally clueless a la AOL rather than take the time (a matter of minutes! as I have proven with my PowerBook) to set up a proper newsreader....)

hey, TIFKAS - I've been to England, and I found the exact opposite of what you're claiming, with much demand for "old, archaic" Atari systems and software - and at a price much less than your precious G3s. Same here in Canada - nice, sovereign, non-US-territory Canada.
And if the Atari MIDI scene is indeed "dead and buried", why then is A) Electronic Cow, a new MIDI Atari software developer, doing so well, and B) Steinberg is considering re-entering the TOS MIDI market in Europe on the strength of the Milan architecture (which you also stupidly tried to smear with your claim that "90% of all TOS application software" falls over).

And while we're on the subject - you claim that Apple is sound

financially by claiming that they have a $2 Billion reserve. My
question on that is a) where and when did Apple find $2 Billion, and B)
if Apple has had this amount of money lying around, then why the heck
did they require Microsoft to give them a $150 million loan to keep
them afloat a year ago? Indeed, the figures I showed at macintouch.com
(a site that I trust over your often overstated "facts") I believe
shows the true precarious position Apple finds itself in.......

Yea right!

Apple just announced today that over 150,000 imacs have been preordered with in one week and that 467 new peripherals and software have been announced since the imac intro on May 6.

To report a sinclap sighting, I will be in Albuquerque, NM at CompUSA from 8/11- 8/13.

Peter S.

>an operating system REALLY require that much RAM and hard drive space?).

Don't go saying that OS 8 is bloated. Sure it takes more memory than previous Systems on the Mac, but it's relatively low on memory usage for a current operating system.

Have you taken a look at how much memory Win95 uses? OS 8 is taking up around 8MB of RAM on my Mac. From what I hear, Win95 uses a minimum of 16MB!

> Besides - if it's not anticipated as a power user's system, then why the heck did Apple put an Ethernet card in it? How many average households (the place where Apple hopes to sell the majority of its iMacs) have more than one computer capable of accessing Ethernet? How many households could afford an Ethernet connection to the Internet? Apple could have easily eliminated this bit of tomfoolery and added a nice standard SCSI interface or a floppy drive to it and made the iMac even more palatable to the average home user - instead, it comes across as more a project built by fanboys for fanboys, and will most likely be sold only to fanboys - the usual state of affairs that is sadly been the pattern for any Apple product.

Good point. Cable modems are expensive, and not available in all areas yet. It won't be for another year or so until my town gets cable modem access. And even still.... I don't subscribe to cable.

As for networking... Households DON'T need ethernet at all. If anything, it should only be an option. So I agree with you fully.

>
> My sister would never add a SCSI device. She is also a doctoral student so she would be fine using the network instead of a floppy drive. I also think that if she needed removable storage then a floppy wouldn't cut it anyway.

The iMac doesn't come with a floppy, but one can be added via its USB port. Apple and a few other third party companies are making varioius different kinds of floppies.

Zip
LS120
normal 1.44

But I did kind of funny that every time Steve jobs has direct control over the design of a pc...he doesn't create floppies for it in its first incarnation.

It was a year or so before the NeXT line started getting 2.88 floppies. One could argue though that a floppy was useless on that machine.

I was a unix machine after all. You don't install the OS or apps with floppies on unix machines, you'd get them over the network or on cdrom. Transferring files you again use the network or the floptical drive.

The only people who complained about the floppy thing were people who were used to using smaller computers, and just couldn't grasp the idea of using computers that didn't have floppies because the files you move around were way bigger then a floppy could handle.

I have a few machines around here that I've built that I didn't install floppies. I just do all my work over the network.

This is why the iMac doesn't come with a floppy. They expected the user to decide if he needed one, and if he did, then he could choose from a number of different kinds from different sources.

Makes sense to me. I like to have choices.

unfortunately, there are also reports that a number of Apple dealers are now scaling back their originally grandiose promotions of the iMac due to not having enough product. Indeed, it's especially interesting to note that CompUSA itself has bungled its own promotion of the iMac to the point that not only were they caught giving out coupon books (used as an incentive to leave hefty deposits for iMacs) which contained coupons for products unsuitable for the iMac, they've now also had the dubious distinction of not having the iMac mentioned in their most recent flyer!

Apple themselves will not be putting iMac on sale on their Apple mail-order store until Oct 1st.

intrigued? Check out http://www.infoxczar.com/atat.

As for the "467 new peripherals and software" - a large amount of vapourware is nothing to brag about. No Imation Superdrive yet, no ZIP available now, not even an outboard floppy drive - what happens if they have a hard drive crash, TIFKAS? 467 new peripherals and software available NOW would be much more impressive.

And as for the floppy being "dead", why is Apple putting floppy drives on their student model? (I just saw it yesterday and was quite impressed). Isn't the floppyless iMac being promoted as an education machine for homes and for people at college?

yep, the authorities will be contacted immediately - to save you from the hordes of angry torch-wielding customers who are sick of your slick drivel. Guess the old barrow-boy will then try to flee to Canada, where he'll get a nice reception at the border ("why HELLO, Mr. 'Canada is a US Tributary'!).........

No they had several models. Two case styles, the cube or the slab. 4
speed ranges 030 and 040 in 25 or 33mhz speeds. Then the last choice was
color board or grey scale.

They weren't so much models as option packages based on the two case
styles.

But they had floppies soon after introduction.

Guys a 233mhz G3 chip is twice as fast as a Pentium II 233 with 512K
cache. So its going to be even faster then twice as fast compared to a
celeron.

This statement is completely false. The "...up to twice as fast..." comes from
a single Bytemark score. If you take the composite of all the scores, the
number is about 40% faster. If you use a decent compiler for the Pentium then
the difference is even smaller. Also, Bytemarks only measure processor speed.
They don't stress the memory system which is important in determining actual
machine speed. PCs have faster buses and a better memory architechture than
Macs.

> Ashamed? The chipset is an Ati Rage pro just like in other apple models.

The Rage Pro is crap. It was reasonably good about two years ago but two years
is a long time in the computer world.

>probably won't be that bit of a deal. In fact, a lot of these users wouldn't
>feel comfortable installing RAM themselves anyway.

Exactly. I know I don't, although I've done it before.

>Schools are part of the iMacs target market and they tend to have Ethernet
>networks. So do college dorms. And cable modems require an Ethernet card.
>What large value do you think that the naive user will associate with SCSI?
>Don't you know people who have never upgraded their computer? I think that
>the iMac is targetted towards them.

Can you tell me how I will get my work to school? Do I have to buy an ethernet
card for my home computer and install a WAN link between me and my school? Or
should I just put it on a floppy and use sneakernet?
Oh, wait, it's not as though I have much choice on the iMac.

I hadn't considered that possibility. I was thinking that they didn't include a floppy drive because floppies are essentially useless for information exchange. Ethernet is useful when you use your computer in a LAN environment, want to connect to high-speed devices (probably not useful for most iMac users) and people who have cable modems.

> That is quite a lot for an operating system, even in our days of cheap RAM.

I guess that depends on your perspective.

> Can you tell me how I will get my work to school? Do I have to buy an Ethernet

If you were living on campus then you would just connect your iMac to the campus LAN. If you live elsewhere then you can use a cable modem. If you don't have cable access in your area then you can dial into your campus network. Transferring 1.44MB over a modem should take under 5 minutes. If you need to transfer over 3MB of data then floppies are useless anyway. So what files are too big to transfer by modem but small enough to transfer by floppy? And if you deal with these files a lot then you can always by a floppy drive, superdrive (if you need floppy compatibility) or a Zip drive.

I can understand some of the lopsided reasoning here. Why don't we
just carry it further? From now on, let us just build houses with no

mailboxes and make postal service something that we have to pay extra
for. After all, everyone has email - or at least more people have
email than have cable modems or a LAN. Broadcast television? Sheesh,
from now on lets save a few bucks and leave out RF capability - people
can only use our televisions with cable and satellite systems - of
course, if they insist on using that old broadcast technology, we have
this handy-dandy little adapter that they can purchase at a 1300%
markup. You mean you actually want a compact cassette player in that
$700 stereo you just bought? Get real. Look - It has DAT and CD
capability, why in the world would you want to use a cassette?

Sheesh

Terry

You need to look at 3Q balance sheet. Apple created the cash by selling off inventory, reduce inventory on hand with more turns and reduce accounts recievables.

Microsoft bought $150 million worth of Apple shares on the open market. Wasn't a loan - did not need the cash- but a committment to the mac platform with new apps.   It worked and brought in new developers.

hello there, iMac fans (and especially its main proponent here, The Idiot Forever Known As Sinclap).....

I just got back from an interesting session at a Mac user group tonight that featured a presentation by Argyle & Broadstreet, who represent Iomega products for Canada, where they talked about and showed a number of Iomega's drives and backup units (many of which, BTW, will work on Atari STs with the proper host adaptors and driver software), among other things.

Well, inevitably, since it was only four days until the launch of the "revolutionary" iMac, someone in the club interested in buying one asked when the USB version of their popular ZIP drive will be available for sale, as he needed this format for backup and for file transfer.

With unflinching candor, the presenter admitted that the USB ZIP was not ready for the August 15th launch of the iMac; indeed, he admitted that Iomega hopes to have the new version of the drive ready by - get this - Christmas 1998: and more likely by the beginning of first quarter 1999 (read: January).

With the ZIP considered perhaps the eventual replacement for the floppy disk, with it used by millions of users for transferring work to their business or for hard drive backup, the lack of a timely appearance of a USB ZIP could well be the deciding factor over whether John Q. ComputerNewbie buys a PC or the "revolutionary" iMac. Thanks to the developers at Apple wanting to impress drooling Mac fanboys rather than stick to existing standards (like installing a SCSI interface so that a user could connect the plentiful SCSI version of the ZIP or ZIP Plus, or even installing an internal ZIP - now that would have been truly revolutionary!), all those who bought an iMac with their carefully saved pennies at launch will now find their systems closed boxes when it comes to transferring work stuff, for transferring school stuff, for doing important backups in case of a hard drive crash, etc. At least until January 1999.

Looks like TIFKAS has some 'splainin' to do when he faces all those angry iMac customers at his CompUSA stores - and he'd better hope iMation is faster at coming up with a (temporary) solution until a USB ZIP is available, as an irate computer user who can't transfer or back up important stuff aren't going to take his glib assurances (or suggestions they buy a more expensive G3 tower system) that everything will be all right....

(To be fair to Iomega, the rep explained that their late USB development came about as a result of Apple adopting it late in the game for the iMac; Iomega does not take Windows '98 as a serious USB platform, as he said that there are still many bugs with its recognition of the devices <like scanners :) >)

also to allay fears of Mac users wanting to upgrade to iMac who have peripherals they've poured mucho money into, the rep mentioned that Asante is coming out in ten days with an Ethernet adaptor that will allow LocalPort printers to hook up to the iMac, and that Hewlett-Packard will be coming out with a box that will allow parallel printers (the long-time proven standard in the PC world) to be hooked up via USB. While welcome news, it still represents an additional expense to those who want to buy an iMac - and could have been prevented had Apple and Steve Jobs used more common sense and less gee-whillikers-dudes in designing the "perfect home computer". Sorry, but I was taught to tell the truth, even if it hurts.

As for the Mac club - there are many fine people there being productive with their Macs, who asked intelligent questions, who were proud to be Mac users and yet were unthreatened when I mentioned that I was the VP of the Atari club - we're even talking about keeping a running dialogue between the two clubs. Indeed, the very antithesis of TIFKAS :) I'm not surprised, for the Mac truly is a wonderful little platform, and I'd hate to see it get crushed by Bill Gates (although what with the recent news on the defeat Microsoft faced when the judge threw out three of their motions - including limiting the time Bill has to be grilled by government lawyers. Bill Gates squirming after endless hours of testimony - I've been waiting years for this :))

the horse is quite alive, kicking, and ready to run the Kentucky Derby - in fact it's a Clydesdale. See my post on the non-availability of the USB Iomega ZIP until January 1999 - which I got straight from the horse's mouth tonight, ironically enough.

The only thing dead here is YOU. From the neck up. (Insert your favorite image from "Death Becomes Her" here).

You often sneered in the past that anything that was coming but was

```
still in development for the Atari platform was "vapour" and couldn't
be admitted as evidence. I'm only sticking to your yardstick here
TIFKAS, and there will be no double standards on your part. And if you
don;t like it, TOUGH. (BTW, what about CorelDraw 8 for Mac :) )

'shyeah right. And monkeys can fly out my butt :)

Believe me, the testimony that Bill Clinton is going to give next week is going to be more candid and believable than ANYTHING you ever post here, you old barrow boy.. Think I'll cross post it to mac.advocacy (you know, the place you fear to tread) and give the REAL Mac users a good laugh (and I will, too.....)

(BTW, I'm surprised that you haven't reacted to the term "barrow boy" yet - and you claim to have British heritage? Better ask your ma what it means, 'cause I expect to see you back here with flames coming out your ears :))

Isn't DAT backwards compatible with cassettes? In any case, I was disappointed when my new stereo system didn't come with an 8-track player. I'm sure they could have added one for about $25 but the bastards ripped me off and now I have to spend twice that to add one to my system.

Sarcasm aside, the challenge is to only add features that your customers are willing to pay for. Presumably, customers will not pay for things that they find completely useless. Floppies, for me, are completely useless (except on my PC where I need floppies for boot purposes). I am arguing that floppies are useless for most people because they are slow, unreliable and don't have very much storage capacity.

> a single Bytemark score. If you take the composite of all the scores, the

> number is about 40% faster. If you use a decent compiler for the Pentium then the difference is even smaller. Also, Bytemarks only measure processor speed. They don't stress the memory system which is important in determining actual machine speed. PCs have faster buses and a better memory architechture than Macs.

Yes the 'up to twice as fast' quote is pretty misleading. The PowerPC chip itself, mhz per mhz, is faster then a pentium II, was basically what I was trying to say. This is why I don't think people should compare the iMac to some lowend P233MMX system. It should be compared to Pentium II systems instead.

PC's now have faster bus speeds. I am typing on a machine that I set the bus speed to 83mhz instead of 66mhz. But all the G3 macs are either 66mhz or 83mhz, so they aren't that slow anymore. I think your thinking of back when they had 40 and 50mhz bus's.

Plus also remember that they have that backside cache (512K or 1meg) that runs at half the processor speed. This is another reason not to compare them to sockey 7 pentium systems.

Design wise they aren't slow anymore. They stand up just fine to Pentium II systems that cost more.

Its that damn MacOS that slows the thing down. If you could see a G3 running linux you'd really see how fast these machines were.

>

Sniff....I own one of these cards...;-)

For 2d stuff they really aren't that bad (remember its designed to be a low cost chipset $20 in order of a 1000). I can't tell the difference in 2d speed between a rage pro and a matrox millenium 2 or the new G200.

For 3d stuff, I'd use 3dfx on either a mac or a PC. But I have seen Quake running in software. The G3 is fast enough that even in software at 800x600 your pushing over 30fps so its fine.

>Isn't DAT backwards compatible with cassettes?

actually, it isn't - for one thing, the cassettes are different sizes. Also, DAT is a digital format, cassette tape is an analog one. Philips did attempt a digital version of the cassette which was backwards compatible with the original format (I've got a Dire Straits tour program that shows Mark Knopfler posing with one of the new machines), but it was rejected out of hand along with Sony's MiniDisc format by consumers who saw it as just another new format, another cash grab by the music industry.

As someone who is slowly going back his hobby of recording, with the goal of releasing my own CD, I know this for a fact, as DAT is a very popular standard in the music industry for mixdown. (Of course, now that Anodyne Software has now come out with cost-effective CD-ROM burner software for the Atari, I can probably do my mixdown right into the Falcon. Now if only CD-ROM burners would come down in price :))

OTOH, if you're in a job that requires you to shuttle work projects to and fro from your home, a floppy disk suddenly becomes a necessity that the consumer needs. (Yeah, I know, standard disclaimer, then the iMac isn't for them, buy a G3 system).

What I find funny is that the new student Mac (which I saw at my brother's work at York University, reminsicent of a beige iMac) has both a standard floppy drive AND a ZIP drive. Apple says one of its markets for the iMac is students and education - if the floppy is REALLY dead (and I doubt it, as the stores here still sell floppies by the truckload), why is Apple still putting floppies on computers for college kids? (Come to think of it, why didn't Apple put a ZIP drive as standard on the iMac? Now that it's been confirmed that it'll be over four months before a USB-compatible ZIP comes out, Apple has really shot themselves in the foot over this one)

It might be twice as fast as a Celeron chip, but I doubt it's
twice as fast as a PII/233, and this is coming from a Mac advocate. Let's
no confuse marketing talk to real life performance. The iMac is going to
be a fast machine, yes, but it's not a speed demon by any means. I just
wonder if it's going to be possible to clockchip iMacs, like it's possible
with PowerMac G3s, by adjusting a couple of jumpers on the motherboard.

Unfortunately, it is. It's a very, VERY lame chipset. Bottom of
the barrel, really. Apple should've used something better, even a 3dfx
chip.

Bad luck for Iomega. A large part of those 150000 pre-ordered iMac
users will end up buying Imation's Superdrive...

> With the ZIP considered perhaps the eventual replacement for the

> or even installing an internal ZIP - now that would have been truly revolutionary!), all those who bought an iMac with their carefully saved pennies at launch will now find their systems closed boxes when it comes to transferring work stuff, for transferring school stuff, for doing important backups in case of a hard drive crash, etc. At least until January 1999.

ZIPs are not the only thing out there for backing up, you know. Apart from the Superdrive, another company, whose name I forgot, is going to release a regular 1.44 floppy for the USB port.

>
> Looks like TIFKAS has some 'splainin' to do when he faces all those angry iMac customers at his CompUSA stores - and he'd better hope iMation is faster at coming up with a (temporary) solution until a USB ZIP is available, as an irate computer user who can't transfer or back up important stuff aren't going to take his glib assurances (or suggestions they buy a more expensive G3 tower system) that everything will be all right....

I'm not TIFKAS (and don't want to be), but I think this subject is of little relevance, as you'll notice, as the iMac launch happens and sales abound.

>
> (To be fair to Iomega, the rep explained that their late USB development came about as a result of Apple adopting it late in the game for the iMac; Iomega does not take Windows '98 as a serious USB platform, as he said that there are still many bugs with its recognition of the devices <like scanners :) >)

Well, you got to admit that Iomega is taking Apple seriously this time, when even Billy Gates couldn't excite them enough to get USB products... It took Steve's machine...

>
> also to allay fears of Mac users wanting to upgrade to iMac who have peripherals they've poured mucho money into, the rep mentioned that Asante is coming out in ten days with an Ethernet adaptor that will allow LocalPort printers to hook up to the iMac, and that Hewlett-Packard will be coming out with a box that will allow parallel printers (the long-time proven standard in the PC world) to be hooked up via USB. While welcome news, it still represents an additional expense to those who want to buy an iMac - and could have been prevented had Apple and Steve Jobs used more common sense and less gee-whillikers-dudes in designing the "perfect home computer". Sorry, but I was taught to tell the truth, even if it hurts.
>

Apart from that, from the word go, there'll be USB-to-ADB and USB-to-SCSI adaptors.

What strikes me is the fact that you fail to see the "big picture". The iMac is not for you. Not for the user with heaps of hardware, bought

over the years. It's a brand new system. Macs in 1984 used 3.5" floppies,
and they were damn hard to find back then, the same 3.5" floppies that you
now want included. Man, it's been what, 14 years? Do you _REALLY_ think
it's necessary? Better, more modern solutions exist. Apple didn't want to
stick to one of the many up and coming standards, so they left it to the
user to decide.
      What I mean is that standards are there to be improved. If you're
happy with old standards, I'd say you should stick to your ATARI. I don't
want to be using the same old cranky parallel port, or the same old slow
serial ports of today, very limited in scope and useability. USB is a
"Good Thing". :)
      The majority of the complains you see about the iMac come from
experienced users. Those are used to the current standards, which won't be
supported on the iMac. But I wonder what will be their position a couple
of months from now, when a couple more USB devices will be out the door,
and running nice on the iMac... And if you doubt that'll happen, well, all
I can say is, wait and see...

You can run MacOS 8 (and 8.5 too) just fine with 32mb RAM and
VM/RD on. You'll only _NEED_ 64mb if you need to open several "fat"
programs at once (I constantly need to use Photoshop, Netscape, IE, Claris
Homepage and GoLive Cyberstudio, all opened at once). Yer average Joe
Consumer does not need to run that sort of programs, specially
simultaneously.
I know what I'm saying because I had a 32mb machine for about a
year, only getting my 64mb G3 a couple of months ago.

> the user can do it himself?

Well, the fact that the user won't be able to upgrade the RAM
him/herself is stupid. Reminds me of 1984. I wonder what kind of screws
the iMac will use... Am I going to need a special screwdriver to open it
too? :)

I understand this problem, and it's a major, MAJOR fuckup.

>
> Besides - if it's not anticipated as a power user's system, then why the heck did Apple put an Ethernet card in it? How many average households (the place where Apple hopes to sell the majority of its iMacs) have more than one computer capable of accessing Ethernet? How many households could afford an Ethernet connection to the Internet? Apple could have easily eliminated this bit of tomfoolery and added a nice standard SCSI interface or a floppy drive to it and made the iMac even more palatable to the average home user - instead, it comes across as more a project built by fanboys for fanboys, and will most likely be sold only to fanboys - the usual state of affairs that is sadly been the pattern for any Apple product.

I disagree. You should read another message I wrote a few minutes ago. The iMac is all about upcoming standards. There's no use in including an outdated standard, when better stuff is available.

Apple only mentioned the home market as their target so far, but I see something much bigger coming... Schools, university labs. The perfect net computer? I guess so...

You really should've skipped the "fanboy" part, since it's utterly stupid. Plenty of Wintel people are endorsing the iMac, it is a viable machine. Just give it some time.

>Sarcasm aside, the challenge is to only add features that your customers are willing to pay for. Presumably, customers will not pay for things that they find completely useless. Floppies, for me, are completely useless (except on my PC where I need floppies for boot purposes). I am arguing that floppies are useless for most people because they are slow, unreliable and don't have very much storage capacity.

I use floppies quite often. Virtually everyone has a 3.5" floppy drive in their computer. That is wonderful in terms of compatability. I need to bring something to a PC... I can format a floppy for PC use. How long does reformatting a Zip Disk take? (PC format with a Mac) Is that really worth it for a 1MB file?

Since floppies are very cheap, I don't have to worry if one breaks. (I think that I have run across three damaged floppies in the past 5 years.) I just retrieve an data I can from it, and throw it out! I'd think twice about throwing a $15 Zip Disk out.

Something that would be nice though.... If the iMac had an option to replace the CD-ROM drive with a re-writable drive.

I shuttle work almost every day. I use a Zip disks because putting 70MB of source code on floppies would be a little bit tedious. If I need a file from work or need to send something to the office, I just dial into the LAN.

> What I find funny is that the new student Mac (which I saw at my brother's work at York University, reminsicent of a beige iMac) has both a standard floppy drive AND a ZIP drive. Apple says one of its markets for the iMac is students and education - if the floppy is REALLY dead (and I doubt it, as the stores here still sell floppies by

> the truckload), why is Apple still putting floppies on computers for
> college kids?

Couldn't say. Engineering momentum? Also, the cost of this Mac may be higher
than that of the iMac.

(Come to think of it, why didn't Apple put a ZIP drive as
> standard on the iMac? Now that it's been confirmed that it'll be over
> four months before a USB-compatible ZIP comes out, Apple has really
> shot themselves in the foot over this one)

I think that Apple should have offered the Zip drive as an option.

> Yes the 'up to twice as fast' quote is pretty misleading.

Not at all, "up to twice as fast" is semantically equivalent to "no more than
twice as fast as." So it could be half as fast as the Pentium and the
statement would still be true.

> The PowerPC
> chip itself, mhz per mhz, is faster then a pentium II, was basically what

> or 83mhz, so they aren't that slow anymore. I think your thinking of back
> when they had 40 and 50mhz bus's.

The PII-400 computers use 100MHz buses.

> Plus also remember that they have that backside cache (512K or 1meg) that
> runs at half the processor speed. This is another reason not to compare
> them to sockey 7 pentium systems.

That won't help the Mac when processing large data sets but I agree that the
G3 Macs are probably faster when their memory systems are not strained.

> Design wise they aren't slow anymore. They stand up just fine to Pentium
> II systems that cost more.

No they don't stand up to PII systems. They have slow buses and no AGP. You
can't get the high quality video, sound, SCSI, etc. cards that are available
for the PC.

> Its that damn MacOS that slows the thing down. If you could see a G3
> running linux you'd really see how fast these machines were.

Yes the Mac OS is slow. Running Linux won't get you a fast video card or a
good sound card though.

> Sniff....I own one of these cards...;-)

I get over 50fps on my PII-400 without a 3dfx card. And, BTW, there is only
one manufacturer of Voodoo 2 cards for the Mac and they charge over 50% more
than the PC cards sell for. I know, I just ordered one from MacZone.

Then why not give the users the choice of installing an ethernet card, a CD-ROM or a modem?
Seriosuly, floppy drives (at least the PC kind) are ridiculously cheap when bought in bulk by computer manufacturers. Why force the consumer to waste more money on something which wouldn't have cost them many extra crowns if already installed in their iMacs?

MacOS is by no means a current operating system, not more so than TOS 3.0 is.
It still doesn't feature something as basic as pre-emptie multitasking, which
wouldn't even make it quaalify as an OS according to some principles.

>Have you taken a look at how much memory Win95 uses? OS 8 is taking up
>around
>8MB of RAM on my Mac. From what I hear, Win95 uses a minimum of 16MB!

8 MB of RAM? My OS doesn't take 8 MB out of my hard drive.

M-hm, they're testing it in my cable network, but I don't know when to expect
its availability or how much it will cost.

>As for networking... Households DON'T need ethernet at all. If anything, it
>should only be an option. So I agree with you fully.

Well, with cable modems, perhaps, but they'd sooner need a floppy drive than
ethernet.

S'OK, the comparison was expected. However there are significant
differences. 8-tracks never had the following of cassettes (or
floppy disks). They weren't as useable, for the most part they were
read only (although there were recorders). And most important, if you
think back on the period, almost all manufactureres phased out the

8-track by including it along with the other options. I'm referring
to something that is in _widespread_ use, with significant utility.
I'm not asking Apple to include device drivers and mechanisms for
paper tape, punched cards or cassettes, after all.

Totally disregarding the fact that part of the reason that they don't
have much storage capacity (relatively) is due to Apple and Microsoft
foisting such bloated applications on the world, they are, indeed,
sufficient for the majority of people - I see it every day at work. I
use them every day at work, and many others do as well.

Brian, I understand your position, and respect your comments, but to say that "floppies are completely useless" is equivalent to someone from Manhattan saying that automobiles are completely useless because there are busses and subways. Perhaps you don't need them, in which case the setup is fine, but there is a whole wide world out there where millions of people use floppies.

I've been doing an informal survey at work. The people I've asked range from complete neophytes to the Information Technologies department gurus. Of the ninety-one people I've asked so far, not a single one thinks that Apple is making a wise decision. Keep in mind that these are both PC and Macintosh owners/users. I asked the 91 (so far) how many times they've used a floppy recently, even with the companies sophisticated network, and it broke down like this (only the most recent use was tabulated, and I didn't ask for any indication of how often they actually used them):

```
               Today:  6
           This week:  9
          This month: 28
       Last 3 months: 43
  What's a Floppy???:  5
```

86 out of 91 sure seems to be a pretty high ratio for an item that is "completely useless."

Probably because they expect more people to find those things useful. They
need to keep the CD-ROM for software installation. I would want most the
Ethernet and modem but making them options doesn't seem like a bad idea.

This is where we disagree. I can't remember the last time that I used the floppy drive on my Mac and I have only used the floppy drive on my PC once (you need to use a floppy to install Windows 95). So, if I got an iMac, what utility would the floppy have for me? None.

1) Less than 5% of my hard drive is used by applications. The rest is for data so "bloated" applications aren't adding much to my storage requirements.

2) What bloated applications does Apple ship or foist us with?

3) Your data requirements are pretty light. I need about 70MB just to transfer my source code to work. Even a typical (1024x768x3) uncompressed screen snap won't fit on a floppy.

4) Why don't you use your LAN at work for data exchange?

I know that there's a demo of it (albeit in German) at ASH's web site. As for a US dealer - I know that Systems For Tomorrow is now the official US dealer for ASH products - perhaps if enough Mac users asked he could start bringing it in for the US market.

I'm trying to find an older copy myself to run on my Powerbook 140 (I use it for work and I'd love to use Edith, Cardfile and STraightFax with it) - has anybody had any experience with it and will it work?

probably due to the fact that this is a newsgroup dedicated to people with Ataris to slug it out with other computer users on why their system is best - a type of debate which is verbotten on the chartered comp.sys.atari.st. Here almost no holds are barred, except perhaps insults against dead relatives :) That's also why forums like comp.sys.mac.advocacy and comp.sys.pc.advocacy exist - to give their users a forum to defend their platform, and to blow off steam - and hopefully to learn about other platforms and what the other guy is using in the process.

Since the iMac is such a hot topic, and there are many concerns about its rather off-beat approach to hooking up peripherals and backup storage, I think it is a most appropriate topic for this forum.

MagiC Mac indeed works well with O/S 8. You'll have to order it from
System Solutions in the UK. They want a written signed order with your
credit card number to make the purchase. Send them an email.

All of those things can be added via USB. The modem comes standard. The
iMac has a built in hardware 56K modem

A local vendor that buys in bulk will be able to sell a peripheral for
the same as apple would be able to.

[Survey snipped]

It's just hard for me to imagine that most people would want a floppy drive.
I look at them as being too slow, low capacity and unreliable. What do the
people at your work use floppies for? Do they have relatively new computers?

A peripheral maybe but Apple could make the hardware built-in and no local
vendor could bet that.

For the most part - in the 233 - 400 mHz range. Quite a few things actually (while granting you that there are many times they can't use them due to file sizes).

- Transferring files between departments is a major use. Each department has its own network, and shared drive. Most people don't want to (or don't know how to) log onto the networks for other departments (in lots of cases, they simply can't, because their userid & password won't allow it). They also do not feel like going into First Class (the email client), finding the email address of the recipient, and determining how to attach the file. It's just easier for them to copy the file to a floppy and put it into an inter-departmental envelope.
- A lot of people bring items in from home, to print on the companies printers, or perhaps touch up in some software that the company owns and they don't or simply to show to their friends. They don't use email, because they don't want the system administrators/company to know what they're doing (or don't know how to access their email address at the company from their ISP). In addition, mail only leaves the site twice a day, so there is no significant speed increase.

There are many examples, those are just 2 ways they use them.

>
>8 MB of RAM? My OS doesn't take 8 MB out of my hard drive.

If 8MB is more than I want to devote to my OS, then I could always install System 7.1 on my Mac. It takes up a little over 1MB of RAM, and will fit onto a floppy disk. And all of my software will still work. (Try downgrading from Win95 to Window 3.1, and see what happens)

As for OS8 being current. Yes, it is. You can't get a more current OS for Mac. Maybe what you're thinking is a "modern" OS. Pre-emptive multitasking? Considering that the MacOS's biggest OS rival is Win95/98, then it should be compared to that...

I don't know if Win95/98 supports pre-emptive multitasking or not. But it certainly crashes more often than MacOS 8 does. I have a friend that works for a software company. He says that his PC crashes roughly once every two hours. He also has a PowerMac 8500 that has been running for about two months without a single problem.

As for your comment about the MacOS not even qualifying to be considered an OS... That's absurd. Without it, the machine would NOT operate. That alone means that it is an operating system. An operating system can be as simple as MS-DOS (even simpler, I suppose). But in the current day of the GUI, 8MB of RAM is a relatively low requirement for an OS.

Nope. Compare it to a good operating system instead. IRIX, Solaris or linux for example.

You experience is the opposite of mine. Even the most trivial of application bugs can crash the Mac OS but Windows 95 offers you some degree of protection.

Your definition of an operating system is very different from the one presented in most software texts. Is the software on your coffee machine an operating system? By your definition it would be because your coffee machine wouldn't operate without it. Still, the Mac OS is, by definition, an operating system using either the "extended machine" or "resoure manager" definitions.

'Fairly cheap' by mac standards. By current
PC standards it's rather overpriced. This
will be a considerable handicap for it as it
goes head to head with cheaper machines. A user
of this kind also will likely be served just as
well by putting NT on that bargain PC as to avoid

```
     the nasty tendency of Win95/95 to eat itself.

     If the machine were priced more in line with what
     it's non-motherboard components cost and came in
     a better case and included some other generally
     useful components that cost in the $25-$50 range
     (for the aforementioned bargain PCs) I would be
     less inclined to heckle it.

>3) Requires little in the way of maintenance
>
>The iMac seems to fit that category fairly well. The only thing that hurts it
>in it's target market is, IMHO, the lack of quality games and the price.

     Cheezing out on the $25 floppy & $50 SCSI interface
     certainly doesn't help either.

The imac does not have a slow graphics card. I saw the imac in Cupertino
recently and its not slow..

>   And as for the G3 desktop - does that $1399 US include a monitor?

> selling in six months come with cheese.

The G3 pro line does not include a monitor but does include keyboard/mouse.
Tomb Raider and Quake will run fine on the imac.

People may decide they want to get a G3 pro model because the price has come
down, I neeed that 17' monitor, slots and floppy.

Or I already have a monitor at home and that this G3 233 desktop or mini tower
is better suited for my needs.

Apple is not making the decision for them. You need to work on your research facts. If the imac was the sole model, you would have an argument.

> >In your slimy dreams...Read above again.
>
> My my, ran out of arguments, so going to ad hominen attacks again. I must really be getting under your skin if I've been asking some really pointed questions. I read the above, and see that you're still living in Bizarro World as usual. My thoughts are based on the fact that every time Apple comes out with a new product, the majority of them are sold to the drooling fanboys, and precious little to PC users switching over. The only reason Apple is increasing sales is the fact that they don't have the clone makers eating into their own margins around any more (and we know how Apple screwed over UMAX, Motorola and Power Computing to become king of the pond again, don't we). This is desparate times for Apple, and they know it (they even admit in papers to the Federal Trade Commission that they're not expecting to run significant profit for the next six months. With the US Navy having dumped the Mac, and Kinkos planning to do so, this is yet another slap in the face to Apple. And flawed boxes are not going to turn around a sinking ship until Apple wises up and gives the consumer what THEY want, not what Apple dictates what they can handle.

I just did not want to repeat myself to the same question. Apple has not yet derived any benefit from closure of the clone business according to Apple's CFO.

Apple has had significant earnings in the last three Q's. Must be the slow news travel to our territory up north. My neighbor to the south must have advance news gathering technology.

Apple is goiving the consumer what they want... The inexpensive imac consumer model and the low price G3 pro line.

> Hey remember the last time someone came out with a computer which was self-contained and had no floppy drive? The NeXT, I believe it was called. The designer? Steve Jobs. Certainly don't see too many of those around, do you :).

Yea but...Didn't Next just offer one model? Now count the models in the mac line and get back to me.

>
> well, you should do your homework before you open your big yap, TIFKAS - you told a Falcon user that he could buy a UMAX clone for the same price of a Nemesis board, which is $100 US - it's not so much a typo as it is yet another example of your disinformation and unsuitability to work in anything other than janitorial work (where your level of incompetence starts). You should also have checked out Godfather Computer's post about their proposed carrying of the Milan - I believe the system now offers a 1.2 gig IDE drive (which are plentiful) and 16MB RAM onboard (up from 8), plenty to run the Milan's version of

> TOS (which isn't as bloated a memory pig as OS 8.1, and can run at

I have been a Mac user for about five years. I do, however, use PC's quite often. I currently own a Quadra 660AV, a IIcx, and an upgraded IIcx (with an '040), and an SE. Every one of these machines is used daily.

I admit that I don't know anything about current Atari systems. That is why I subscribed to this newsgroup. I loved Atari years ago. If it is still around, I want to know about it.

For the time being, my main use for computers is graphic design. Lots of that is web site design. I'll be the first to admit that alot of sites that say "Made on a Mac", are horrible sights to behold. My only explaination is this... These people have the tools to do it, but don't have the education behind it to make it effective. It is sad.

A friend of mine recently bought a Dell 400MHz Pentium II. For games, it is alot faster than my Mac Quadra. (50/25MHz '040) But when it comes to web browsing and other internet use, my Mac outpaces his PC in almost every aspect. This is especially surprising when you consider that my Mac only has a

28.8Kbps modem compared to his 56K modem. Go figure.

As for this discussion about the iMac, I agree with those of you who don't like it. Personally, I think that the all-in-one computer is a thing of the past. The current thing nowadays is upgradability. I think that the iMac is a huge mistake by Apple. I am surprised that there is so much anticipation for it. I mean... who cares? If anyone wants power and expandability, go for a modular computer.

Personally, I don't focus on the speed of the computer. I bought my first Mac because I liked the interface. To this day, I like it better than Windows (3.1, 95, 98, NT). When it comes to PCs, I am more comfortable using DOS. I would be very interested in seeing an Atari machine. (Or Milan? I really don't know anything about it.)

Just finding out that there is a computer that still uses an 040 chip intrigues me. It sort of makes me feel warm and fuzzy inside, knowing that my machine isn't really so out-dated after all.

Sincerely,
John G.

     Considering the realative quality of the rest of the components
     in an iMac, a celery system is an appropriate comparison. While
     it is true that it may not be a better number cruncher, that
     really wont matter as the rest of the iMac isn't set up to
```

handle such tasks anyway.

The CPU performace defecit is of no practical consequence.

That's why they will let the store that sells them the 3D
accellerator do it for them. Like always, they'll still end
up ahead in terms of price relativel to Apple.

2M graphic cards are strictly bargain basement territory.
Considering that Apple is too ashamed to mention just what
2D/3D chip they're using, it's a safe bet it's an S3 Virge
or somesuch (all you informed types know that that means).

     Depending on the needs of the user, software availablity
     due to current monopoly forming market dynamics excepted,
     an 040 mac would be just as suitable.

     Although, oddly enough, it may be easier to find software
     for the the ST.

     Mind you, I would love disproof on this point as there is
     a relatively nice 040 Mac emulator for DOS/Win/Linux.

Maybe not because getting support if you screw anything up will be pretty tough. Also, you may have file interchange issues that you are not savvy enough to deal with.

> That argument is pure sophistry, and you know it. The point is not high frames rates for "Quake", but the level of sophistication the iMac allows for today's games, and more importantly, tomorrow's games. They are not just "blood and guts" games, but flight simulators, 3D Sports Game (Golf), RPGs like Riven, educational games (ex: VR tour of the Titanic), etc.

You can't buy a cheap computer and play the latest games. That applies to PCs as well. I have a PII-400 and a Velocity 128 AGP video card and I can't play all the greatest games. One of my favorite games is BattleZone and I downloaded an updater for it yesterday. Unfortunately, I had to turn off a quality option because my system wasn't able to handle the larger textures. There are also games that require a Voodoo card and, I'm sure, some will soon require a Voodoo II card. And I paid $3000US for my computer just three months ago.

I think that the Mac OS is easier to use than Windows.

Fair enough.

My sister would never add a SCSI device. She is also a doctoral student so she would be fine using the network instead of a floppy drive. I also think that if she needed removable storage then a floppy wouldn't cut it anyway.

I have a 6100/60 and a Dell XPSII/400 and my Dell destroys my Mac speedwise.
Maybe your friend is not acheiving 56K connections?

This is what Gene Steiberg has said about his imac loaner unit.

http://www.azcentral.com/computing/news/mac/steinberg.shtml
Read it and weap!

'The 15-inch color screen is sharp and clear, and the built
in video acceleration chip makes screen display speedy,
almost instantaneous, very much like the big monitors
with high speed graphic accelerators you see in large art
departments. There are stereo speakers that provide fake
SRS surround sound with decent quality.'

     Still, it's a trivial piece of hardware in terms of cost
     & complexity that adds rather secure, simple & ubiquitous
     data transfer. It's one of those things that often seems
     pointless a great deal of the time but is quite useful in
     those rare instances.

This isn't something occasional. We both connect to the same web sites frequently. When I say that my computer "outpaces" his PC, it is only a slight advantage. If a page takes 20 seconds to load on his computer, it takes about 16 on mine. This may not sound like much, but his PC is (technically) 8 times the speed of mine, with a modem that is twice the speed of mine. I can't get over it.

>Maybe your friend is not acheiving 56K connections?

It says 57,200 bps (or some similar number) when it connects. And in the browser window, I've seen transfer rates of 6KB/sec. That seems about right.

My Mac connects at 28, 800 bps. The usual transfer rate in Netscape is 3KB/sec. But it occasionally jumps up to 4 or 5. On several occasions, it even reached 7KB/sec. And I am sure that these are not loading from the disk cache. (I delete it often.)

Nonetheless... I am always shocked that his computer isn't faster than mine. It just doesn't make sense.

When you say that the IBM Ambra has more software available... you mean games, right? Now *that* is productive.

So... How about them Ataris?

As far as I know, the Asian market is doing us all in at the moment. The U.S. isn't holding up any better than Canada. As far as I'm concerned, Canada has hockey. While down here in the U.S., we have the twin deficits. (federal budget deficit, and the trade deficit.) Hey... At least GM isn't striking anymore.

So... On with more important news. I have heard that the Milan has an 040, and I have also heard that it has an 060. Just how much of a speed increase it is from an 040 to an 060?

Now here is a key word. "Almost". How close is almost? My ATI Mach 64 seems pretty damn quick too. On a six year old machine at that. Image that:).

> very much like the big monitors

"Very much like". As in a VW bug is almost like an old Speedster?

> with high speed graphic accelerators you see in large art
> departments.

"Large art departments"? When I walked into my sons art class, I thought it was pretty big too. Did he say they were using Degas for their layout?

> There are stereo speakers that provide fake
> SRS surround sound with decent quality.'

K-Mart sells stereos with "decent" quality, even with their company logo on front. Does it have 16 mono or 8 stereo output? Does it have an optical digital IO? Does it have SMPTE?

To be honest, it reminds me of some sort of diving helmet off a B SciFi flick.

Me too. I _NEED_ that _SEVENTEEN_FOOT_MONITOR_.

I think I can do without the seventeen foot slots and floppy.

For months now, TIFKAS has been trumpeting up and down that Apple
Computer has never been healthier. And yes, in light of its impressive
past three quarters, it sure seems that Steve Jobs has actually turned
the company around.

However, the numbers may not be all that they seem - and Apple may
well still be in dire financial straits, and they know it. Which is why
the iMac may be their last gasp.

To show that I Am Not Making This Up, go to
http://www.macintouch.com/norr021.html and get the rest of the story
(complete with large colourful graphs that even TIFKAS can comprehend).

The numbers don't lie!

The "revolutionary" iMac certainly has the attention of the popular computer press. After all, this "everyman's computer" certainly sounds impressive on the surface with its 233mHZ processor, built-in Ethernet and all-in-one design.

However, one Mac user came home from Cupertino and gave it some sober second thought - and decides he doubts the iMac will really change Apple's fortunes. He especially is concerned about no floppy drive and no standard printer port (things that mindless Mac cheerleaders like TIFKAS tend to shrug off or gloss over as "not being important").

Interested in reading this other side of the coin from a dedicated Mac user? Go to http://www.macintouch.com/imac2.html - it's a very well-written article, with some insightful thoughts and concerns.

Guys like TIFKAS should just read their Little Golden Books, as the content of this site may make them physically ill......

The "revolutionary" iMac comes complete with 32 mB DIMM RAM as standard. But what if the Mac power user (and believe me, there will be lots of Mac fanboys buying this thing) want to go to its full 128mB capacity?

Well, unfortunately, they'll do so and lose their one-year warranty too! Seems in order to install the RAM, they'll have to remove the processor card - and incur the wrath of Jobs. Poor design, bad thought.

Don't believe me? Go to http://www.macintouch.com and check it out!

Who's crying now, TIFKAS?

I never use floppies anymore. They are too small to hold a useful amount of
data. A Zip drive would be more useful.

I don't see why a power user would buy this computer. I consider myself a
power user and I'd want: more RAM expansion, PCI slots, a floppy drive, a zip
drive, a 19" monitor, a DVD-ROM, some internal disk bays, etc. Therefore, I'd
never even consider getting an iMac. I'd also never get a laptop. Both are
not targetted towards me.

You said "So what" when I stated that the Mac OS is easier to use. I explained why I thought that this was a relevant point. Now you are challenging my original assertion. Why didn't you do that when I first brought it up?

I haven't commisioned any studies to support my position that the Mac OS is easier to use than Windows but I am a consumer so my perception of a product is relevant.

> A zip drive would not have quite as trivial a cost associated

I agree. But if I were to buy a Mac, I would not want it to have a floppy drive. The small increase in expense would not be justified by any increase in utility.

I would say that a power user would be just about anyone who would crave getting the most performance out of any computer; the fact that the iMac is expandable RAM-wise shows that Apple anticipates that existing Mac owners will want this machine and will want to take it to its next level. Besides, in order to make use of the bloated OS8 more efficiently (and run programs with it) you really have to bring up the RAM to a more "acceptable" level (and I know of what I speak - my brother installed 64 megs in his PowerMac in order to make the most of having OS8 installed on his system - it is a neat operating system with some interesting ways of accessing the desktop and the drives, but does an operating system REALLY require that much RAM and hard drive space?).

The big problem, of course, is what happens when the RAM is needed - and now? Apple built a door on the iMac so that the RAM could be accessed for swapping for bigger RAM - this implies that a user could easily do the swap himself. But if he does it himself and wants to go to the full nine yards, he kisses his warranty goodbye. I'm sure TIFKAS will argue that his authorized Apple service centre can do it for the customer, but remember that Apple, in its cost-cutting measures to stay afloat, has slashed the number of service centres - for someone in Chicago or Toronto, that won't be a problem, but what about the guy in Boogie, Iowa who ordered his iMac straight through Apple via mail order (remember, TIFKAS pooh-poohed this scenario as a non-issue when it was brought up in this forum a few months ago)? And why have a middle man install the RAM when Apple has a door on the computer that implies that the user can do it himself?

Besides - if it's not anticipated as a power user's system, then why the heck did Apple put an Ethernet card in it? How many average households (the place where Apple hopes to sell the majority of its iMacs) have more than one computer capable of accessing Ethernet? How many households could afford an Ethernet connection to the Internet? Apple could have easily eliminated this bit of tomfoolery and added a nice standard SCSI interface or a floppy drive to it and made the iMac even more palatable to the average home user - instead, it comes across as more a project built by fanboys for fanboys, and will most likely be sold only to fanboys - the usual state of affairs that is sadly been the pattern for any Apple product.

Hello All,

I am liquidating my studio equipment!

I have Atari ST�s, TT�s, Atari 19� monochrome monitor, MIDI software including Cubase Score among others, an Tascam 388 8-track reel to reel,

out board gear and MIDI instruments. I have published the list of equipment at: http://www.cape.net/glgallery/studio.htm

Please pass this URL to any who may be interested.

Thanks, Wylie Johnson (watchman@cape.net)

It'll run fine, but of course it won't be up to the quality you'll get with a PII/300, which costs lots more than the iMac.

The iMac is really useless for the hardcore gamer, the one that will want Tomb Raider to run at its best. For the casual user, it'll work just fine. The hardcore gamer is better off with a Playstation anyway.

I'm don't think that the iMac's RAM expandibility supports your claim "...that
existing Mac ownwers will want this machine..." Some Mac users might want an
iMac but, IMHO, most won't.

> ... - it is a neat operating system with

That depends of the operating system and what you want to do. Using an SGI
with less than 128MB or RAM can be painful. NeXTStep performed best with
>32MB RAM.

If you are a naive user than getting your RAM installed by a technition
probably won't be that bit of a deal. In fact, a lot of these users wouldn't
feel comfortable installing RAM themselves anyway.

Schools are part of the iMacs target market and they tend to have Ethernet
networks. So do college dorms. And cable modems require an Ethernet card. What
large value do you think that the naive user will associate with SCSI? Don't
you know people who have never upgraded their computer? I think that the iMac
is targetted towards them.

Yes, it does...
>
Computer speed has little effect on browsing speed.
A 56K modem will only operate at a 'safe' speed, which is tested
continuously, and the connection speed of 56k is only the maximum transfer
speed attainable, which is practically impossible unless you have a short
and perfect line to your ISP.

The real determinate factor is the server speed and line quality.
The only fair comparison between two machines is if you both use the same
ISP, and from the same location, and at the same time.
All these factors play a role, and the relative speed of machines has
little impact.When browsing the web on my 486DX4/100 , with a 56k modem or
P166 with the same 56k modem, speed is practically identical.

Regards,

Clockmeister.

And why have a middle man install the RAM when Apple has a door on the computer that implies that the user can do it himself?

Me thinks your crying over spilled milk here. As for support in Iowa is further from the truth. Their is a CompUSA in Clive plus countless Apple store front dealers all over the state. All accessible by nice interstate highways...

However, there will be at least 50+ new CompUSA stores in the comming months due to the acquisition of Computer City(110 stores). I am dreading this because my plate is full anyways. Maybe I can pick up the CompUSA terrritiory in Canada, USA.

Nice Try..

Because Apple is going to sell lots to higher education students who most
likely will have ethernet hookup in the dorm room...thats why.
     Also many
communities down south here are being hooked up with Cable modem access.
Here in Garland, Texas..plus other Texas communities...TCI Cable offers cable
modem services for $40 month which includes email. I am tempted...

Numbers don't lie its just how you look at it. Apple has clearly shrunk in
size.  However, in the past year they have gotten their financial house in
order such as growing their cash on hand to $2 billion and three profitable
Q's.  The balance sheet doesn't lie.

We read the same SEC document? In every SEC document for legal reasons dire
uncertainties are included.

As for Apple cutting to the bone is farther from the truth. Apple will
release the imac this week plus updates to the G3 pro line soon according to
various news outlets if you believe them. Apple has hardware/software
roadmap going forward. Plus earnings amd revenues will grow by Q1/99 due to
imac and new stuff..

I have for sale an Atari 1040STE in really good condition boxed with
instructions all disks etc.. a couple of boxed games.

It all works perfectly apart from the internal disk drive which will simply
not play disks it whirs around but wont load them.

Im willing to sell it for �30.00 ono

Why not see what can be done with a Linux box?

It would likely end up being considerably cheaper
on either the PC or Mac side assuming the software
support is there.

Hmmmm, make a decision like that based upon one application huh? Do
you do that? If they want to move over it's their decision.

>The Mac/wintel platforms are more powerful for less money. That concept has
>been lost on the Atari boobs(since I own Atari game machines, does that make

Powerful? Maybe. A bus is, after all, more powerful than a
motorcycle. And you have that nice little man sitting in the front,
telling you where you want to go today, just like the nice little
people in Redmond and Cupertino.

Boob I may be, but I'll stick with my Atari. It's not so much the
'Presence of Light' as the 'Absence of Dark'.

>Just curious..

<nod> I see. I always understood curiousity to mean something entirely different, but perhaps in your lexicon it is defined as "Mindless drivel based upon insufficient and unsubstantiated information endlessly and indiscriminately foisted upon those who dare to snicker at your every foolhardy attempt to formulate a coherent thought."

I'm not sure that I understand this one. From what I've read, the iMac has the following ports:

(2) USB
RJ-45 (for 100Base-T ethernet)
(2) RS-232 (for phone and modem)

All of these ports are very standard. I would be more worried about the lack of built-in MIDI.

well. maybe I did go a bit overboard there :) I HAVE seen USB working (went to a pre-launch demo of Windows '98 with my boss) and was most impressed - and I'm glad to hear regarding MacWorld that there are some more USB stuff coming with Mac drivers (though I suspect that the USB market is coming in more with the launch of Windows '98 and that Apple is riding their coat-tails). See, unlike TIFKAS, I DO check out stuff before I open my big yap, and I DO admit when I'm wrong - unlike TIFKAS, who responds with insults and bragging about his monetary assets and his "abilities" as a "macho stud" in order to mask the fact he has the IQ of a burrito. :)

Still, for a musician, the ability to have a configurable system is paramount. In the case of the iMac, the way it's designed precludes any attempt to modify it to use it as a hard-disk recording station, much less any upgrades you need to do (what if you need to upgrade the RAM? Is it any wonder Apple buckled under and finally made a 56K modem standard rather than the 33.6 they were originally going to foist on their customers?). And in the case of hard-disk recording with a computer, SCSI is the standard for its proven track record of speed and reliability; USB is an unknown quality for the moment whether it can

handle this. I'll have to ask Club Cubase if there's any plans to
support USB in later versions of Cubase VST.

one thing is still certain that we can agree on though, TIFKAS is
still a loser troll who's forgotten his original primary goal of
defending the Mac (a platform that for the most part can defend itself)
in order to try to get the last word - and has made himself a
laughingstock to all computer users in the process. :)

     Until better support for USB actually comes on line, yes
     it can be considered a non-standard port.

Do you mean support in the OS sense or in the sense that few vendors have products for it? I would disagree with the first because the Mac OS simply treates USB like ADB and Windows 98 has explicit support for USB. I would disagree with the second because there are quite a few peripherals that you can get for USB right now. And if you can't get a peripheral that you need for USB, you can always spend $50 on a USB->SCSI adaptor.

If you need tons of RAM (though the iMac will allow you to go to something like 256MB, I believe), a really fast HD system and lots of upgradability then you are well outside the market that target market of the iMac. You are also looking for a solution that Atari cannot provide.

USB is cheaper, allows you to add and remove devices while your system is
running, allows more devices and doesn't require the user to select IDs. OTOH,
it's slower. In any case, USB is not meant to replace SCSI. It's meant to
replace parallel, serial, joystick, keyboard and mouse ports.

Just listen to yourself..All your posts directed to me have a insulted and
attacking tone. Your the one who's blood pressure is getting all bent out of
shape.

A computer is a computer, a tool...Nothing more.. Not a religious jihad...

Enjoy life..

> Still, for a musician, the ability to have a configurable system is paramount. In the case of the iMac, the way it's designed precludes any attempt to modify it to use it as a hard-disk recording station, much less any upgrades you need to do (what if you need to upgrade the RAM? Is it any wonder Apple buckled under and finally made a 56K modem standard rather than the 33.6 they were originally going to foist on their customers?). And in the case of hard-disk recording with a computer, SCSI is the standard for its proven track record of speed and reliability; USB is an unknown quality for the moment whether it can handle this. I'll have to ask Club Cubase if there's any plans to support USB in later versions of Cubase VST.

I suppose when I get my imac later in the year, it's cable modem 'baby'.. Since the cable modem will be installed in my super fast standard 100mb ethernet port, should have i paid for this unecessary modem which I will not use?

Also I will have to pay a $150 installation fee regardless that I have a built in ethernet connection. The fee is the ethernet card for the wintels..

> one thing is still certain that we can agree on though, TIFKAS is still a loser troll who's forgotten his original primary goal of defending the Mac (a platform that for the most part can defend itself) in order to try to get the last word - and has made himself a laughingstock to all computer users in the process. :)

Who cares...Listen to yourself.. Its only a computer not a religious awakening..

Non standard ports? USB is industry standard.. You need to rethink before
your foot is stuck you know were..

When I am in Calif next week, I will ask the folks(idiots according to you)why
they went strictly with USB on the imac.

```

> Atari was still a company and the Falcon hadn't been introduced yet, and I used that STE with (regular) Cubase for a couple of years. Then I started thinking about switching to a PC or MAC, but I decided to upgrade to a Falcon around 1994 because I got an amazing deal on one from a large music store chain called Guitar Center. They were phasing out their Atari support, and the sales guy didn't seem to know much about the Falcon. That was around the time new Falcons (4 megs / 80 meg HD) were going for around $1300. I go it for less than half that (new in the box with all the software).

Nothing wrong with honest discussion in were you want to go today regardless of some boobs comments.

> Anyway, I've been using it with Cubase Audio now for a couple of years, and with the 16meg memory upgrade, and 4.29 gig Seagate Barracuda drive, it works pretty well. But seeing my roomate's new (and cheap) PC running Cubase VST (as well as the extremely cool Rebirth TB 303, TR 808 emulator), I must say switching over is looking very good again. I'm toying with the idea of getting a NEMESIS accellerator board for my Falcon, but I can't help but wonder if my money would be better spent on a new PC or MAC?

Depends on the cost of the board. Most likely that the price for the Falcon card could yield you a spanking new Umax Powermac clone with at least a 240 mhz processor for $599. Price includes 32m and 3G's..

> Don't get me wrong. I enjoy the Atari, and can do pretty much everything I need to do with it (Internet, DTP, music, etc.) but that's beginning to change - at least with regard to music software. Of course I have heard many stories of timing problems running any incarnation of Cubase on a PC, and the G3s are still quite pricy - but I'm pretty sure I'd want one over a PC (for music especially). And of course I don't care to add to Mr. Gate's bottom line either - which is impossible _not_ to do with the PC route. So, for now, I'm sticking with the Falcon, but in the near future, who knows...
>

But you maybe missing out...Now that PowerMacs and wintels are super cheap you can use the power of the browsers - IE and Communicator to get full use of the web...$599+ buys a nice close out umax Mac OS clone..

This is a little long, sorry, but I just had some random thoughts regarding price and power.

Just a little background: I work for an international paper products company, and my particular mill employs approximately 1,300 people. In my capacity as a 'spare' I have occasion to work in many of the departments throughout the mill.

This week, I am working in materials (or purchasing). Of the fifty-nine purchase orders that I sent out, seven were ordering personal computers (6 PC, 1 Mac). I know, from working in (among other areas) Information Tech., Accounts Payable, and Purchasing that my company is averaging about 25 personal computers a month. Anyway, as I was entering the purchase orders for these computers I started thinking about TIFKAS' assertation that 'Atari Boobs' refuse to accept the fact that a Mac or Wintel platform is cheaper and more powerful than an Atari.

Here is a rough idea of what was spent on these computers, and just a minimum of software - mostly Office '97, and some licensing fees.. Three of the packages were over $8,000.00.; three were a little more than $6,700.00, and one was just a little over $5,800.00 (and no, it wasn't the Mac). This is just for the basics: drives, modems, monitors - no printers or anything. Now, I understand that corporations are more likely to spend money on features that they don't really need and that that accounts for part of the price, but we're not talking supercomputers here... mostly just 233 mHz Pentiums.

OK, now.. the company buys these systems, let's say at an average price of around seven thousand dollars. What happens with them?   How are they actually used? (And remember, I actually work in all of these departments, so I see it firsthand)

1- As a terminal to network to our company's AS 400 Business System (just recently upgraded from a System/36), running software that for the most part was written in 1984. This is where the real work is done, not on the fancy PCs.
2- Trying to use Excel as a spreadsheet, desktop publishing program, forms generator, data base and lord only knows what else.
   a- Word? Hah. Most never touch it, and aside from occasionally changing fonts, some basic tables, and the laser printed output, they don't do anything I wasn't doing with Letter Perfect on my 400 way back in 1980.
   b- Access? PowerPoint? (and so on) - 19 out of 20 wouldn't even be able to tell you how to load & run it, much less what it was for.
3- Playing Solitaire, pinball, minesweeper, checking email, and printing photos/graphics that they downloaded from the internet.

Naturally, there are some exceptions to this, and some groups actually get some good use out of some sophisticated applications, but it is either on a turnkey computer, meant to manage process control or things of that nature - the engineers doing their blueprints, and the IT people themselves - but that amounts to less than about 2% of the computers in use at my mill.

A day doesn't go by that I'm not called by coworkers 5 to 12 times to help them figure out how to use a program, recover from a crash, or explain how to set up their computer at home. I have no idea why they would call me, instead of Info Tech.... after all, I'm just an 'Atari Boob.'

I'm constantly amazed at the number of simple (or complex) things that I can't get accomplished on these $7000 systems that would take me a matter of seconds on my Atari. Why should I have to be told that there is no .dll to import a JPEG into a report I'm generating? Be told that I can't use the 16-bit version of Acrobat Reader with this 32-bit Operating System? Not be able to access files because some of the desks are using Windows 3.1, some '95, some '97, and some NT? Now, granted, this is all a function of the available (or installed) software, but if the company is spending $7,000 then I sure as **** should be able to do something that I am able to do at home with shareware or freeware programs. Sure, go out and buy the software you need. Add it right on top of the $7000 you've already spent.

And don't even talk to me about crashes and munged applications... Or cooperative multitasking... or network failures... or or or ad infinitum.

I've a coworker that bought himself a nice Aptiva back in April. He did get a pretty good deal on the computer itself... But now, months later, after purchasing a monitor, printer, scanner, photo printer, digital camera, and gobs of software that he himself admits that he'll probably never use, he is up to a total investment approaching _ten_thousand_dollars_ .... so, let's not blithely talk about how cheap PCs and Macs are, alright?

A couple of corrections:
That's 59 purchase orders today, not this week :)
and
In the "Constantly amazed" paragraph, I meant Office '97, not to imply
that there was any such beast as "Windows '97"

I live in Canada so the retail scene may be different but my local Future Shop sells USB keyboards and mice. I doubt that a lot of other peripherals have hit the retail level because only people with new PCs running Windows 98 can make use of them. I'm not sure that retail level availability is an argument against a standard, however. I can't buy SCSI devices at Future Shop either.

well, hello sports fans (but espescially The Idiot Forever Known As Sinclap)...

I took the plunge for work and bought myself a nice used Mac PowerBook 140 for use as a PDA unit. And so far, I'm quite pleased with it.

And, as you can see, I'm posting this using Newsreader, the wonderful USENET newsreader program for the Macintosh. Which mens that if someone like me can get on the USENET in minutes on a Mac with just a small amount of configuration, then someone like SinClap, who has ranted long and loud about how his Mac is more capable of being an internet machine than us poor "Atari boobs" should be more than capable of taking the plunge and not having to use the crutch of DejaNews to post his MCIBTYC drivel.

the writing's on the wall, TIFKAS, PUT UP OR SHUT UP.

BTW, no need to worry folks - I'm still in the Atari camp, for as soon as I get this puppy a bigger drive and more RAM it's gonna become the most perfect Atari laptop you'll ever see via MagiCMac :)

I have to say that I agree and disagree. The situation you describe is common enough and I see much of the same thing myself. Lots of money spent on hardware and software that isn't understood, isn't used or doesn't work.

However, it's perfectly possible for a consumer to educate themselves and put together a decent system that does work and doesn't cost both arms and a leg. Notice I said possible, not common.

Still there's something to be said about the lure of using the ST and even older systems. These were machines, as were the machines before them, that you could really understand and that you could actually make do the things that you wanted to with a reasonable investment of time and money.

oh, that's nice TIFKAS. However, the cost of the Nemesis is $100 US, or $159 CDN - and I know that because I have one in my Falcon, which I bought from Titan Designs on one of my trips to the UK.

Care to share with me your source for a $100 US Umax clone? 'Cause I'd like to buy each member of my family one :)

Only a "boob" like TIFKAS who has no idea what he's talking about would make that gaff. Next time do your homework before you presume to make one of your "expert" advice to us Atarians (like calling Calamus crap when you've never even used the program, or claiming the the Milan "fails to run 90% of all TOS software").

You need drivers for each of the devices that you attach unless they will work with some sort of generic drivers. Windows 98 provides those drivers for keyboards and mice but you need software from the vendor to support their particular scanners, printers, etc. (though drivers for some of these devices ship with Windows 98 and are hot loaded when they are needed). I haven't heard of any USB device support for FreeBSD.

> That's the whole point of standards, actually; so that

That's not a very good definition of a standard. I like the Merriam Webster defintion better:

...
(3) something established by authority, custom, or general consent as a model or example
...

As you can see, the definition doesn't not guarantee any particular level of usefulness. There are many standards for computer hardware that have never been directly useful to me.

OUCH. Bring back SCSI...

Still, even then, it's a driver support issue which typically
is a vendor issue & not an OS one.

The alternatives you suggest all run Multi-tasking OSes (with the exception of the Mac which sort of pretends) ... Multi OSes and MIDI do not get on. Time and time again musicians bare testimony to the rock-solid timing of the humble single-tasking Atari ST.

VST is pants as is any program of its ilk. Despite what they would have you believe music cannot be made within a computer only and a good sound requires an outboard mixer, effects processor, professional digital mastering format etc etc not to mention the difficulties of plugging acoustic instruments or high-quality microphones into the badly insulated poorly performing reality that is a 'sound-card'. Of all the many home studios AND professional studios I have been in I see one computer in use more than any other ... an Atari ST :)

A true classic.

Jim.

SCSI requires drivers for it's devices as well. The OS may provide drivers for generic storage devices and scanners but it can't provide support for every conceivable device. Just as USB can't.

> Still, even then, it's a driver support issue which typically
> is a vendor issue & not an OS one.

Very true. All you need is a driver for the interface card and then the vendor can support their particular device.

Which I already explained: USB allows the hot attachment/removal or devices,
USB allows 127 devices, USB doesn't require the user to set device IDs and USB
has a huge maximum cable length.

Not to mention it provides comic relief & Bill's expense...

At the rate USB vendors are moving, SCAM just may
overtake them. They've had a free ride onto most

new systems sold lately & haven't done much to
take advantage of it. Infact, SCSI based solutions
have seen their largest market penetration during
that time.

That's really funny. Your talking to users who have kept the same
machine for probably six to ten years and you idea of a long time is a
couple of weeks? Your a real joker.

>Now that Cubase VST has been avialble for the PowerMac line for some time. Why
>would new Cubase users and Atari legacy ST folks would upgrade to a Hades,
>shades or what ever instead of a PowerMac or wintel based cubase solution?

Because of the Mac O/S. Real simple. It isn't good enough for the U.S.
Government, why shoud musicians put up with it?
>
>The Mac/wintel platforms are more powerful for less money. That concept has
>been lost on the Atari boobs(since I own Atari game machines, does that make
>me an Atari boob?)

How can something cost me less money if I just remain with the system
I currently have in use? Surely they are not giving PC's and Macs (at
least not yet) away?

Why no response to the Dept of Navy dropping Apple and going to Win 98
based machines for servers? Actually another update since that post is
a directive from the NAVAIR commander that in a couple years, only PC
based machines will be allowed for offical use on hundreds of
thousands of government employees desktops.
That really has to put a dent into Apples plans considering their
declining rate in the market place.

USB wasn't really viable for most vendors until Microsoft added support for it
in windows. USB is a good standard and I have already explained why.

I wholeheartedly agree. As I said, those were just some random thoughts. I respect the ones that approach the system as a tool, because it offers a way of accomplishing something that they need to have done. It is just unfortunate that so many pursue - shall we say - "other venues".

>Still there's something to be said about the lure of using the ST and

My original 400 is still in use daily at a friend's photo lab. Sure, it's almost 20-years-old, but as long as it continues to accomplish what he needs done he plans on keeping it.

Terry

This upsets me. The Amiga kernel is central to its efficiency and
general behaviour. Using another kernel will make it somwething else
than an AmigaOS.

>It's for real dude, and it's an Amiga and it's not a PC.

I'd say it's neither or a little of both.

>I can't see a PC being 5-10X faster then the current PII by end 1999.

If the Amiga can, why not the PC? And how do you know this isn't
vapourware?

>Besides, what the hell is the problem with having another alternative to
>Intel ?.

I welcome all alternatives, but I want to keep the Amiga alive, and
I'm not sure that Gateway are planning to produce an Amiga.

Hello to all,

I've had a 520ST and 1040 ST running since 1986. Just got a 4 meg Falcon.

I'm hoping to find original disks for some of my old programs, particularly
the old Astrology program that came from the APX or Antic archives.

Any leads for those things? My wife loves the old Astrology program, and I'll
buy it from someone if I need to.

Thanks,

Craig Morehouse

One of the first big MiNT distributions, the TAF-kit, came with X11 as default
GUI. It works nicely on a 4meg ST. But lemme get this discussion straight,
so far the line was that an Amiga can do anything an Alpha can do in Linux
because an Amiga will run Linux as well, but that this doesn't go for Ataris
because MiNT isn't fully Linux compatible? Are we forgetting that Linux will
run on an Atari as well? (And, again, that X will also work under MiNT).

Maurits.

     It may not necessarily go for MiNT.

     That does not address Atari in general.

     A Falcon will quite happily run Linux and could
     quite happily contribute to a D2 render farm
     right beside an Ameboa, an Alpha, a Sidewinder
     or any other supported platform...

Pretty simple. The Mac O/S and Win 95/8. Why make it hard on yourself
when you have one of the simplest and most compact O/S's available to
utilize with one of those powerful clones (opps, clone is not a
Macster term anymore:).

>
>The Mac/wintel platforms are more powerful for less money.

More powerful, but still slower with the O/S that they must toat
around. Besides why should a PPC user be afarid of a little old 060?
Must be fear to cause you to post here. What else could it be? At
least you'll still have a home here when Apple goes under:).

>  That concept has
>been lost on the Atari boobs(since I own Atari game machines, does that make
>me an Atari boob?)

Considering only in the last year processors have been able to manage
the giant O/S's Apple and WinTel machines use, I think that Atari
users have done quite well with their selections in the past.

Atari Fans! Finally a Microsoft product you can use.

Guaranteed not to crash! (Although, it burns quite well.)

Priceless!
(Slightly higher in Canada)

is pleased to announce the immediate availability of fine, handcrafted writing paper:

100% Hand-made
100% Recycled
100% Post-Microsoft content

OK, not so fine actually. I'm just starting this and am learning as I go - But it is perfectly useable writing paper, approximately 8.5x11 inch. Guaranteed to be 100% repulped Microsoft documentation and MS generated printouts. This is the first in a series of Atari-related items that I will be making available. This is pretty much just to raise a small amount of capital to enable me to make Atari-related memo pads, blank books (and some with Atari info, I'm in the process of negotiating with some people at the moment) and a planned Atari-generated, hand-bound (hard cover) Atari-specific book (hopefully the first of a series).

Contact me for more information

tross3@hamtel.tds.net

Thanks!

Terry Ross

FS: I am selling a bunch of my Atari stuff in order to raise some money toward the purchase of a TOS clone. I haven't decided which clone to buy yet, it'll be a toss up between the Milan and Wizztronics machine.
I have divided the stuff up into two groups. The Jaquar Group and the ST Group, and that's how I want to sell them. I live in Loudoun County, Virginia which is in the greater Washington, D.C. Metro area, so I'm looking for buyers primarily in that area , it'll cut down on the cost of shipping :).

JAGUAR GROUP
Complete Atari Jaguar
Complete Jag CD
11 Carts and 3 CD's

ST GROUP
Complete 520ST with 4megs of memory
19 Programs, 27 games, and 1 joystick

Interested persons may email me at: Seahawker@juno.com
Thanks,
Sam Ferrer

He he...I eventually well one day. I am just to worn out to do so from my
busy schedule plus I like deja. You need to read before you critcize because
there are Atari Jihads who use deja as a newsreader..

Can you run pointcast?

Nothing slow about OS 8.1...Not afraid of the 060...the PPC line is modern and
costs less than 060's.

"who needs modern processsors, thats why I have the 060"

one other thing - at least those who go into comp.sys.atari.st with
Deja do so to ask intelligent questions rather than to disrupt it with
brain-dead flamebait like a certain Mac advocate we know does (and I also
believe that Deja has a users agreement that makes such behavior
grounds for disconnection).

>
>Can you run pointcast?

show me where I can find it, and I'll be more than happy to try to
set it up. You realize, of course, that if my PowerBook isn't designed
to run it that it would be perfectly pointless.

I think if you look a little closer, those who've been posting with
Deja have been running Wintel machines, and have mostly curious about
comp.sys.atari.st and its content. Quite a few want to learn how to
hook up properly using their Ataris.

As for "Atari Jihads" (a term I find offensive), the only person
that's fit that description in years recently appeared in
comp.sys.atari.st advocating hatred, abuse, and death for anyone using
any sort of Microsoft product (yes, including Internet Explorer for the
Mac). Let's say that after the flames subsided this idiot was rendered
extra-crispy :) by those in the group who, though they have legitimate
beefs about other platforms, are way more open-minded to those who do
use those other systems.

Where did word processors come into the discussion?" Were are talking
about production 68060 processors currently being manufactured
by Motorola and used in several desktop systems now around the world,
and replacing the 68000/040 embeded systems rapidly.

Yea, I like to go to C.S.A.A and watch one with the pet name of
SinPlop reach around his behind and eat what he spews from his mouth.

You've lost your touch, SinPlop. Why don't you just go purchase one of
Bill's machines like your shrink says and get it over with. You'll be

a lot happier.

The leading Linux print publication _Linux Journal_ is running a WishList/Survey @ http://www.linuxresources.com/wish/ for titles that people want ported to Linux. I couldn't help but notice an entry for Cubase...

...if any of you think you might be interested in Cubase for Linux you might want to mosey over there and vote.

While there's a certain implicit assumption that these ports would see the light of day first on PC Clones, Linux also supports a wide array of other platforms, including 68x00's with MMU's (TT, Falcon, A2000).

BTW, has anyone tried Linux on any of the newer TT clones?

     Pointcast is a push client that requires a proprietary
     server for support. Niether of those attributes are
     particularly impressive.

This arrived in my mail the other day - thought you all might get a smile from it - I did !

Subject: The new IMAC's - Specificaly created for users

From: Apple Canada - Creators of the finest computers on earth.

To: MacIntosh Users Everywhere.

With the successful introduction of our new IMac we have redeveloped the platform to conform to users needs.

Specifically, our new IMac comes integrated with specific software and hardware for certain groups of individuals (see Chart below). These IMacs will be available soon at fine Apple Dealers everywhere.

IMac G3 Tailored systems Code 39474

AhhMAC - System suite of software and hardware for Medical Doctors/Nurses.

OiMac - Jewish and Hebrew text, translation and OS

HighMac - Control and maintenance of Hydroponic operations.

EhMac - Canadian translation software and OS

FlyMac - Air Traffic controllers and Pilot operations software.

AyeMac - Irish, Scottish Translation software and OS

SighMac - Psychologists and Social worker software.

WhyMac - IBM and compatable software solutions.

NighMac - Portable system with FRIENDly software solutions.

WryMac - Complete tools for debugging,virus killer, systems diagnostics, etc..

PieMac - Software for Bakers and Donut shops.

CryMac - Baby food preparation and diaper change software.

GuyMac - Race car driving software, Bikini beach Internet Access.

EyeMac - Laser Surgeons operations software and OS.

TaiMac - Tai-Chi and Karate systems solutions. -- *Do not confuse with TAIMac.. our Taiwan translations software.

ByeMac - The end of this comical text.

Dear Sirs or Madams,

I am sure that Dejanews can relate to small niches in the computer market place, and the effects of even minor bad press or content can have in those areas.

The comp.sys.atari.st, comp.sys.atari.tech, comp.sys.atari.programmer and comp.sys.atari.advocacy are groups that help propel the continued use and marketing of Atari related software and hardware. These groups are frequented by avid Atari users from around the globe. Many programmers continue to release new software or announce updates to existing applications there. Several Atari/TOS clone manufactures announce the release of new, Atari compatible clones on a basis almost as frequent as Apple announces it's new products. These products fill a niche market, and are often marketed at a cost that barely covers production and development, by people that understand computer users with alternative ideas on what current personal computing needs are. These newsgroups provide the necessary global communication which enables users such as myself to maintain my personal computer activities.

First, I would like to point out that I think that Dejanews provides one of the most important aspects available to Web users. Information. I realize that it is up to each user to evaluate that information, and decide themselves the accuracy of its content. However, the users of the above newsgroups have had to tolerate the intentional attempts of one particular person to denounce any new release of Atari software and hardware from within those groups for the last several years. It would be understandable if his comments were confined to the advocacy group, where such "flames" and "mud slinging" are considered acceptable, but he continues to interfere with the function and charter of the other existing Atari newsgroups. During these past years, complaints have been sent to Internet Service Providers from which he post his messages from, and what I believe to be factual, has either been told to cease and desist, or had his accounts revoked.

At this time, this user, Sinclair2246@my-dejanews.com, continues to promote his destructive statements and inaccurate facts and opinions by means of your service, Dejanews. While not taken seriously by established users, the deterrence of even a few new users to the Atari community can mean a loss that is felt by all in our community.

With that said, I respectfully request that you investigate his continued abuse of these newsgroups through the Dejanews posting service, and for myself, and a hundred other users, remove his privilege of using your service to continue this undermining presence of an immature, irresponsible Apple Computer Representative.

With deep regrets,

Michael Grove

ahh, trying to compare a Milan with an Atari 800? Two very different machines - that's like saying "I breathed on a Commodore 64 once, therefore I'm an expert on Gateway's plans for the Amiga". Anyone who would seriously try to compare an 800 with a Milan is dangerously idiotic and should be kept away from any position in the computer industry (except for sweeping the halls at Intel) Try again, weinerhead.

(No insult meant to all the nice Atari 800 users reading this :))

>Patrol has you on the undesirable alien list...

so not only did you flunk history, political science and geography, you also got poor marks in economics. What did you do major in in university, TIFKAS - "Baiting Feminists 101"? The problems with the Canadian currency at the moment has more to do with Asian markets. Or are you posting from an alternate universe (this explanation makes more sense, as everything that TIFKAS says makes more sense if prefaced by the disclaimer "In Bizarro World.....")?

As for my own "undesirability", I happen to hold dual citizenship to both the US and Canada, and have gone across the border twice in the last year with no major incident - same as the fact that I've travelled to the UK three times in the last three years, again with no incident. The only reason that I'm unable to attend the Las Vegas show is due to time constraints related to my job. Maybe a nice letter to DejaNews complaining of slander to my character should cure you of that embarrassing habit of not thinking before you post....

my,your insults are getting lamer and lamer - like I said, I was re-elected by acclamation in May, and haven't gone for the president's job as the current president is doing an excellent job - why ruin a good thing :).

Just about as lame an insult as "you will be eating your spinach", which is doubly stupid when you realize that a) I LOVE spinach, and b) you keep posting this in newsgroups full of Popeyes. Honestly, like Bluto you act tough but you go down with one punch when your stupidity and lack of credibility reveals itself.....

You lost me right here Michael. You think that someone should not be able post bad content because it would hurt particular brands of computers? That is obsurd. I also read the rest of your letter and the only thing that I agree with is that Peter should not post advocacy in non-advocacy groups. This group, by charter, is dedicated to "...attacking and defending Atari computers..." and Peter has violated neither neither the spirit nor the letter of this charter. His "flames" and "mud slinging" have been mirrored by other posters and have been more personal in nature. The Atari advocates certainly do not have the moral high ground here.

BTW, he is certainly a moron who annoys people but that can hardly be helped.

Yes, Brian, I agree - we should leave poor Peter alone. He has enough problems knowing that Apple has just lost the US Navy and (something he doesn't know) my multi-national paper products corporation - who are not only stopping all purchases of Apple products, but attempting to dispose of the ones that they own - this is unofficial at the moment, but it's happening none-the-less. This is all probably just a plot by the Atari Jihad, and other Atari boobs... Why get 'personal' when you can insult everyone at once? Including citizens of a sovereign nation that he continues to claim is but a state of another nation?

BTW - is it just me, or has anyone else thought that the iMac looks like a 1940's Popular Mechanics' artists impression of what a 1970's vacuum cleaner would look like?

as a citizen of the said sovereign nation, let me add that Sinclap is obviously posting his flames to get attention - and my job is to give Sinclap attention, but not necessarily the type he wants. Seriously, he is in much need of psychiatric help and I hope that he will come to realize that he needs to clean up his act and seek the therapy he so obviously needs. Otherwise he may find himself nominated as "Kook Of The Month" at alt.usenet.kooks .

From my end here in Canada, I am seeing a lot of Apple activity - but not all of it good. Appland - a longtime Apple dealer and chain of stores across Canada - just folded a few months ago, and the dealer that's popped up in its place is running on a skeleton staff, very little product on display, and no new software. The Computer Centre on College and Spadina, which for the longest time was 50% Apple, 50% PC, has now had PC stuff encroaching in the Apple department - more software than the other store, but still nothing around the "12 30-foot piles" that Sinclap claims. And I'd hate to see what's going on at Computer City now that the idiots at CompUSA are taking over (you might

want to read the article at http://www.maccentral.com and find out -
seems that the $800 coupon book they're offering for pre-registering
the iMac has many products that can't be used on it). The only business
that's doing good is EduConnect at York University, and that's because
my brother's helping on the Mac side of things - he's everything a Mac
advocate SHOULD be and more, including being fair and honest and not
ridiculing one's choice of computer just because it's not the flavour
of the month.
>
>BTW - is it just me, or has anyone else thought that the iMac looks

Well, maybe it was to long winded and did not contain the proper sentence structure to get my point across. You quoted a statement made early in the letter, but go on to say you agree that he should keep his post in the advocacy group. The post that are outside the advocacy group is what caused me to express my opinion. The fact is that he will carry an arguement to whatever extent he feels is necessary to get a reply, even posting to the incorrect group, which he has. My point is that a hand slap is not enough in his case and he should have his user status at Dejanews revoked due to misuse.

>This group, by charter, is dedicated to "...attacking and defending Atari
>computers..." and Peter has violated neither neither the spirit nor the
>letter of this charter.

Peter uses the group for advertising purposes. Consider what you state above, and tell me again that it is ok for Apple (he does represent Apple does he not?) to plug ads for their machines in an Atari newsgroup? Besides that point, how can someone honestly attack the Atari platform with the limited experience he has with the product. 99% of his post belong in the alt.rec atari group where the common thread is "The Jag is crap" headders. The person is here in attempts to cause discouragement among the active users that care to read his post. Probably only one percent of the active users even bother, but the group is daily seeing new users come fowared, and here is where the issue lays. A good arguement, sure. Even some good mudslinging. But it belongs in the advocacy group. And it would be nice if the person on the other end actually had some knowledge of what he was attacking. He does not.

> His "flames" and "mud slinging" have been mirrored by

"Screw" the morals. It's been balls out here for a few years now. I don't care if he sleeps with Sheep. You want to know my moral ground? Since we're in the advocacy group where little kids don't belong, I think he is a piece of shit. How is that for a cro-magnum 'tude?

If he could channel some of that into constructively advocating Apple
it would serve him well. As long as he continues his present course
all he gets from me are vague feelings of pity and a minor curiosity
as to how many shootings of Morton Downey, Jr. & Rush Limbaugh he
actually watched. Same repetitious, loud-mouthed foundationless,
blabbering employed by all three of them. Hardly worth taking action
against - although Michael did have some valid points IRT newcomers to
the Atari scene. Anyway - keep up the good work :)

Don't misinterpret me now - gloating was the farthest thing from my
mind when I mentioned Apple's dwindling base. I support them and hope
for them to succeed - just pointing out that the signs don't look
promising.

Maybe he should not be allowed to post to any group with *.atari.* in it except this one? I wonder if Dejanews could enforce that... You know that if he losses his Dejanews account he'll just start using a conventional newsreader.

> Peter uses the group for advertising purposes. Consider what you state

Actually, I think that he works for a retail company (CompUSA?) that sells Macs and PCs.

> And it would be nice if the person on the other end actually
> had some knowledge of what he was attacking. He does not.

Looking for knowledge on the internet is probably a waste of time :-) I've been having a discussion with a guy in another group for over a week and I still can't seem to convince him that preemptive multitasking is better than the cooperative multitasking used in the Mac OS. It is amazingly frustrating but I think of myself a teacher of the ignorant masses (well not quite).

I don't have a problem with it. OTOH, I try not to violate netiquette by
attacking anyone personally. I believe that, except for Peter, I have only
failed once.

no misinterpretation intended - as a matter of fact, I don't gloat
over Apple's problems either. I do highly respect the Mac to the point
that I bought a used Powerbook a few weeks ago; I'm still quite
fascinated by how good it is and how it's going to help with the job I'm
in (I needed some sort of PDA I could take to trade shows to take notes,
as well as a portable Internet computer so I could do web searches for
my boss whenever a customer needed some info that's not quite available
from our end). The only things I've been critical of have been the way

the company has been run into the ground, the blown opportunites to make the iMac REALLY attractive to the first-time buyer (that is, using standard SCSI and printer ports so that they, not Apple, get to choose what hooks up to it. That and Sinclap's constant obliviousness to the facts and his bullying behaviour towards Atari users and hardware/software developers and merchants (you'll notice he NEVER posts to the mac.advocacy or comp.sys.mac) - certainly he'd like the challenge of a REAL debate among his peers, especially those who really posts the truth about Apple's situation.

I don't have a problem with him in this newsgroup, at least as far as
his rights are. I doubt that the letter I sent was even considered.
Most of the time ISP's simply say it looks like your group needs a
moderator........

Yea, he has brought me to skullduggery a few times and I couldn't resist,
but I try to refer to him in the third person whenever I can (even
to him).

He needs to say away from the .ST, .TECH, and .PRG Atari groups.
Unless he would like to use his wisdom with the Mac OS and start a
MagiC Mac help list. But that would require an effort. It is much
easier to just randomly look in newsgroups and type some stupid
statement.

Actualy I concentrated in the International Relations area of my Liberal Arts
BA. I kind of miss the Foreign relations classes...as U.S. foreign policy,
Middle East classes that had Palestanians and the Jewish students. Very
entertaining, informative and relevance. Sorry no mention of Canada except
that the U.S. Secretary State is considered the quasi Canadian representative
- foreign minister. Why not close down the Canadian embassies for eficiency?

As for the Feminists...I was on some of their shit lists considering I vote
democratic.

Slander of character?  Get real..every post directed to me by you is slander.
 I just brush it off as banter.  You all take this serious...I don't..

After a days work this is unwind therapy..Nothing more..

FYI:  I hold a dual citizenship to both U.S. and UK.

Is you mother or father/either Canadian and American or vice versa?

Apple run into the ground? Were have you been in the last 12 months?

Apple is aware of the issues of leaving the old legacy ports and floppy out of the imac. The imac is not for everyone thats why there continues to be the G3 line. Apple did drop prices today. Their online store lists the G3 233 desktop at $1399 and the G3 233 Tower at $1499. Which is $100 and $200 above the cost of the imac. The current mgt is not stupid. Mitch Mandich has done alot in the last year..Only if you knew the internal details..

Looks like all glitz and no substance. That is not an interface for
useful work, it looks more like someone is trying to do a "Kai".
That is not the Amiga I know.

You misunderstand. I was speaking conceptually.
Pointcast is an internet push client. It pushes
information to users in a fashion similar to TV
as opposed to a pull client like gopher or
archie or a web browser.

Pointcast is nothing to cry over wrt lack of support.

Although icq is slight nifty. If Sinclair weren't such
a moron he might have mentioned that instead. Icq (in
case you dont know) attempts to solve the ISP/dynamic
IP problem for net users.

The client is being reverse engineered and the results
should be available for use under any platfrom, including
the ST.

If it's a netclient worth bothering with, there is likely
some reverse engineering project who's work the Atari
community could take advantage of.

Well, with deep regret, I announce that it is offical. As of July 23, 1998, we the employees of the Naval Air Warfare Center, are no longer able to purchase desktop Apple computers for use within the DOD. I assume this to mean the Command, which includes Pt. Mugu, White Sands, Pax River and China Lake.

It's a shame as most people last year and part of this year were only just starting to replace old 603's and 604's with G3's. Only but a handful have current Apple machines.

On the plus side, this does leave the opertunity for new PC owners to install one of the many Atari emulators (not that MagiC Mac is bad at all) on their new desktop machines and run old Mac software with Gemulator.

It's kind of sorted, but it looks like the advocacy wars will be coming down to how many machines your platform can be emulated on, and not the release of the iMac.

Mike

If you did not see our original message a couple weeks ago regarding the Milan, please read on and then send us an email so we can get you on our database. This way we can keep you posted if you are interested in buying a Milan in the USA... Email: tj@godfather.com

The staff at GodFather Computer, Inc. would like to thank all the folks who sent us an email regarding the possibility of distribution of the Milan Computer in the USA. We must say things are looking good thus far.

We have been told an english version will be available very soon and once this happens, our plans are to acquire one for testing purposes in our USA office. We want to make 100% sure this product is made well and that it performs as advertised.

Once we feel comfortable that the english version is solid, we will start to accept pre-orders for the Milan. Our goal is to locate as many USA customers as possible for this 1st order so we can all keep our freight costs down since shipping from Europe to USA is not always cheap.

Although the exact price has not been set, here are the initial specifications of the Milan system we will be selling for approx $899 (USD) plus freights (freights being from Europe to USA to your doorstop):

Milan Computer housed in the designer Milan style case, 16MB RAM, 800MB to 1.2GB HDD, 1.44MB FDD, Keyboard, Mouse, 2MB Video Card, Milan OS, a Milan revised TOS 4.x, and manual.

GodFather Computer also sells a great line of monitors and laser printers to companion with your new Milan. 14" monitors start at only $109, 15" at $139, 17" at $249, 19" at $549, and 21" at $919. Our Digiview and Decaview monitors come with a 3 year warranty and the Milan at this time comes with a one year warranty.

Again, these are only preliminary specifications but we expect the final cut to be fairly similar if not exact. The main goal is to continue letting you know of the progress being made on bringing the Milan to the USA.

As soon as all the above items are 100%, we will add the Milan information to our web pages and begin to accept pre-orders.

Thank you again for the interest in the Milan Computer.

well folks, it's another 11 days until the arrival of the iMac, the "revolutionary" new computer that will, in a CompUSA executive's words, "will make PC users switch to Mac".

But what's this rumbling going on in comp.sys.mac.advocacy? What's this hubbub of discontent?

Why, it's all due to the discovery that the iMac, with all its "innovations", handles its graphics duties using an ATI Rage II Graphics card - which is considered a dinosaur and quite slow at refreshing graphics. And while you can upgrade the RAM in it, you can't replace the card for a faster one. Another example of Apple "thinking different"? Of cutting costs? Or of once again proving their level of incompetence?

What happens to the consumer, six months down the road, when he gets a great new game and finds that he can't run it on his iMac because it crawls like a wounded snail? Does this mean that all the new developers that Apple has been boasting about will have to "dumb down" their neato new games? Will Eddie Punchclock be enraged when Lara Croft doesn't go through her moves as fast as Joe Lunchpail's PC which he bought for prices way below the iMac's $1299 US price AND can upgrade to faster video cards (as well as hooking up to industry-standard peripherals, which USB has yet to prove due to its dearth of on-sale-now peripherals). Will he ever consider buying Apple again?

My prediction: the iMac will do initially well (how can it not do well at first with all the drooling Mac fanboys wanting to have one of these on their desks?) only to suffer a severe slump due to the fact that the average consumer wasn't born yesterday and wants to make their own decisions on the computer they want for their household and not to let Apple make the decision for them. Honestly, this is shaping up to be potentially the biggest marketing disaster since New Coke.....

Of course, we in comp.sys.atari.advocacy want to hear the positive spin on this by TIFKAS (The Idiot Forever Known As Sinclap), our own resident MacDavidian. He's a man we can trust - he advised us that we could buy a discontinued UMAX Mac clone brand new for $100 US (the same price as a Nemesis card, folks!), that "90% of all TOS application software falls over on the Milan" (which should be of interest to the official dealer of the Milan computer in the US - kin you say "slander suit", boys and girls?) and his hilarious rantings that Canada is a US tributary (despite the fact that in 1812 Canada wiped the floor with the US Army at the Battle of Fort York - no wonder the US Navy decided to drop all purchases of Macs if their salespeople are obvious idiots despite their fancy college diplomas). And of course, his usual lame insults to yours truly, like his classic "you will be eating your spinach" (had some last night, yum!) or his attempts to smear me as a "wimp" because I and the membership of TAF am satisfies with my performance as their VP and don't want to topple Ken MacDonald as pres. Hey at least my insults back get laughs.....

     Apple: making standard features on $600 computers special,
          extra cost, 'frills'.

     Any of them can be. That's the point. It will even be a
     decent PnP bus as well, reliable at the bios level such
     that even Linux can take advantage of it with out much
     fuss.

>
>The imac is not for everyone. Thats why I have been holding seminars in my

     That's the real trick. It's hard to tell just who this
     machine is targeted to and if that group is more than
     just a null set.

If you want slots, floppy and legacy ports there is always the G3 Pro line.

How many of those sub grand wintel boxes are upgraded with new graphic cards?

The imac is not for everyone. Thats why I have been holding seminars in my
Comp stores for the last two weeks to educate the store folks on how
differentiate the imac and the G3 pro line to customer needs. Apple has
reduced pricing of the G3 Pro line. The starting price is $1399 for the G3
233 desktop which is only $100 more than imac.

I never stated that the Umax clones were priced at $100. If it was posted
that way than it was a typo. You can get close out S900's below $900 fully
loaded. Much more of a value than the Milan. I am shocked that 800MB HD's
are still available.

Peter S.

I doubt that this group is the null set. If my sister was in the market for a new computer then I would consider recommending the iMac to her. She has had her current computer for about four years. She has never added more RAM, changed monitors, added any peripherals, etc. You have to remember that a lot of people have very limited needs. They want a computer that is:

1) Easy to use
2) Fairly cheap
3) Requires little in the way of maintenance

The iMac seems to fit that category fairly well. The only thing that hurts it in it's target market is, IMHO, the lack of quality games and the price.

maybe you should go to the PC section of your CompUSA stores and find out. Judging from your posts at The Mac Doomsday Clock, you're just as clueless on PC systems as you are on passing judgement on Atari systems.

ahh, that's so funny - I believe that Steve Jobs made it clear that the iMac was designed as a household computer and for the first-time computer user, and designed for ease of use - I would imagine that that would be designated for "everyone". Why is Apple then pushing games on the iMac (which will be the first to suffer under the iMac's slow graphics card)? Turning around and saying that the iMac is "not for everyone" is an interesting about-face, and smacks of the elitism found amongst MacDavidians such as yourself.

And as for the G3 desktop - does that $1399 US include a monitor? Cause if it doesn't, that adds at least another $300. Does it include a printer? Does Apple still charge extra for a keyboard and mouse on top of that price. Plus, IMHO, the customer who comes in expecting to buy an iMac, is told "no, Tomb Raider and Quake won't run on it, but I've got this nice G3 system that will" will look to John Q. CompNewbie like the classic bait and switch - and he will immediately go to the PC section of your own store to buy a PC that WILL run what HE wants on it. Lame lame lame - with that attitude, the only Macs you'll be selling in six months come with cheese.

>In your slimy dreams...Read above again.

My my, ran out of arguments, so going to ad hominen attacks again. I must really be getting under your skin if I've been asking some really pointed questions. I read the above, and see that you're still living in Bizarro World as usual. My thoughts are based on the fact that every time Apple comes out with a new product, the majority of them are sold to the drooling fanboys, and precious little to PC users switching over. The only reason Apple is increasing sales is the fact that they don't have the clone makers eating into their own margins around any more (and we know how Apple screwed over UMAX, Motorola and Power Computing to become king of the pond again, don't we). This is desparate times for Apple, and they know it (they even admit in papers to the Federal Trade Commission that they're not expecting to run significant profit for the next six months. With the US Navy having dumped the Mac, and Kinkos planning to do so, this is yet another slap in the face to Apple. And flawed boxes are not going to turn around a sinking ship until Apple wises up and gives the consumer what THEY want, not what Apple dictates what they can handle.

Hey remember the last time someone came out with a computer which was self-contained and had no floppy drive? The NeXT, I believe it was called. The designer? Steve Jobs. Certainly don't see too many of those around, do you :).

>I never stated that the Umax clones were priced at $100. If it was posted
>that way than it was a typo. You can get close out S900's below $900 fully
>loaded. Much more of a value than the Milan. I am shocked that 800MB HD's
>are still available.

well, you should do your homework before you open your big yap, TIFKAS - you told a Falcon user that he could buy a UMAX clone for the same price of a Nemesis board, which is $100 US - it's not so much a typo as it is yet another example of your disinformation and unsuitability to work in anything other than janitorial work (where your level of incompetence starts). You should also have checked out Godfather Computer's post about their proposed carrying of the Milan - I believe the system now offers a 1.2 gig IDE drive (which are plentiful) and 16MB RAM onboard (up from 8), plenty to run the Milan's version of TOS (which isn't as bloated a memory pig as OS 8.1, and can run at impressive speed under the "obsolete 040") and all at the same $899 US proposed price point as was stated six months ago by Milan gmbH - I'd say that's added value, and you'll be getting much more support from Milan than you will from Apple on your bargain bin UMAX. And at least I can plug industry standard peripherals and PCI cards into it (and with a standard floppy drive), unlike your iMac, which is looking more and more like a candidate for the dumpster every time I see those specs of its.....

here's a post from comp.sys.mac.advocacy (you know, the place TIFKAS is too afraid to tread) showing why the iMac's puny graphics card may be its (and Apple's) own undoing. It's very well written, and pretty eloquent in its thoughts.

Actually, nearly everyone who's an avid gamer bought a PC a long time ago.
But having lost that market, are you saying Apple shouldn't even try to
get it back? They've lost overall market share too but you're gung ho on
them getting that back. Why would games be different?

> The people who claimed that RageII is going to prevent the iMac's success

You're right and that's not what I'm talking about. I'm talking about
"causal" and "intermediate" gamers, and people who don't even think of
themselves as gamers. The "3D revolution" is starting to bcome huge, and
iMac users will simply be left out. If iMac constituts a significant
portion of Mac sales, that leaves a big chunk of the Mac market out too.
I'm more concerned with those casual users who simply aren't aware any of
this is happening (a level of ignorance that most people including
yourself share). Another thing is I know a ton of people (including
myself) who were never terribly serious gamers before--I'm 30, I've never
had a Nintendo or anything and practically never went into an arcade
before, and only played computer games occasionally in the past. But now
some games are compelling enough that I've started playing them a lot.
Because I happen to have PCI slots I was able to add a 3Dfx card, which
dramatically improved the gameplay experience in several different games
(and positions me for many games coming out soon). If my computer had Rage
Pro to begin with, that would probably be sufficient for the time being
(it's only a little less powerful than 3Dfx Voodoo Graphics).

> So, I'm of the opinion that faster graphics would not help iMac sales all
> that much. Until someone comes up with some evidence refuting that,
> they're just speculating.

Again, it's not really the initial sales that I'm worried about (though I do think that good 3D demos can be _very_ impressive and gain a fair number of sales, especially for a computer like the iMac which depends so much on image to sell itself...a lot of people would see that as a way to avoid buying a separate console to play games on, or a way to make everyone in the family happy) I'm really more worried about a million people buying it, and say 100,000 of them trying to play some top-selling game this holiday season, and finding that, if it runs at all, it _sucks_ on the iMac, and they'll start asking questions about what's wrong (they won't know it's the Rage II until someone tells them Apple sold them a lemon...). And the only reason that might not happen would be if we're still only getting 1-2 year-old games this holiday season instead of new ones...

Also, it affects the actual chances these "hot" 3D games will get ported in the first place. Some game which requires a 3Dfx-level 3D card, and won't run on the iMac, can only be sold into a much smaller proportion of the Mac market. Paradoxically, if a million people buy iMacs that otherwise would have bought expandable G3 PowerMacs (which already have Rage Pro built in and can easily add Voodoo 2 or whatever), that's 1 million _fewer_ people to potentially sell such a game to, in a market that's already marginal in size. At the same time the iMac is "expanding" the Mac market overall, it could actually be shrinking some important segments.

> I _have_ consistently asked you to prove that the number of people who
> demand high frame rates is significant. You've never done so.

That argument is pure sophistry, and you know it. The point is not high frames rates for "Quake", but the level of sophistication the iMac allows for today's games, and more importantly, tomorrow's games. They are not just "blood and guts" games, but flight simulators, 3D Sports Game (Golf), RPGs like Riven, educational games (ex: VR tour of the Titanic), etc.

But just for laughs, here's a stat for you: GameSpy, which searches for Internet servers for Internet Quake, has had over 1 million registrations. That's ONE game, and only counts people interested in Multiplayer (which is a small part of Quake sales).

Answer this question, which is actually answerable: Do you take issue that games are a significant part of the consumer market? And if so, play your own game and supply some figures to back that up. My evidence: The game rack at my local Fry's is about 1/3 of the entire software department.

And then tell me why, if games are an insignificant part of the consumer market, Steve Jobs cares about it?

Maybe in your world there is no room for fun, but in my world I'm telling you that it's very likely the lack of decent games is going to kill the idea of an iMac in my house. You can fool the adults, but you can't fool the kids.

Why can't you show some credibility and just admit that Apple screwed up? And I notice that you are afraid to answer my other key question, so I'll answer for you: The path to relevence for Apple is for the Mac community to show "tough love" and kick their butt until they get it right. The iMac does not deserve our loyalty and deserves to go down in flames. The iMac 2, now, maybe they'll get it right.

Grandmaster Bubba

They said that this machine will be better than any consumer PC available.

If you ask me this new computer doesn't realy sounds like a Amiga at all. It will only be compatible with old amiga apps through emulation. The OS will be completely new and based on a outside developed kernal like BeOS, or Mach. This you can already be done under Linux. It will not include a Motorola CPU, it's probably going to use intels comming Merced chip, or something else shitty. The "new" amiga which will be like a bridge to the new platform which will be released later this year will be based on the Pentium, so it's clear that they will go for the x86/intel line like everyone else. Don't forget that Gateway has only made intel boxes and never even seen a PPC.

Basicly it's a completely new computer and OS with the Amiga name on it. It's like buying a PC whith the Commodore sign on it. It has got nothing at all to do with Commodore.

What about the Digital Alpha work stations?

That are real computers! After an 8 bit spectrum and a 16/32 bit
Atari it is time to scale up again. Not to a lousy 32bit system. That
was interesting 10 years ago. Nope, time to get 64 bit hardware, that

is progress!

The Alpha processor is for serveral years the fastest processor
available. The newest stuff if quite expensive. But if you go for
the outdated stuff you get a good price. Outdated are:
300-400MHz 21164 processors, they come typically with 96kB
2nd level cache and 1Mb 3rd level cache.
(My system, 300 MHz Alpha 21164, 1MB cache, 64MB RAM, SCSI CD ROM,
1GB SCSI harddisk, Matrox Millenium graphics card and ethernet
network was about NLG 2500 or about 1250 US$, half a year ago.)

Take as OS Linux and you have some real computing power on
your desk.

Bye, Hans

Is the latest Alpha 5-10 times faster then a PII 400Mhz/100Mhz bus ?.

Apple has been around for over 20 years. That's a long time for a computer manufacturer. I don't think they'll be disappearing any time soon.

Are you saying that if a new ST was released it would have to be 100%
backward compatable with the old eighties designed hardware ?.
Emulation is a great solution for backwards compatability.

> new and based on a outside developed kernal like BeOS, or Mach. This you
can already

The kernal will "borrow" parts from other OS's, a lot of the features of
workbench will be retained and enhanced further.

> be done under Linux. It will not include a Motorola CPU, it's probably
going to use
> intels comming Merced chip, or something else shitty. The "new" amiga
which will be

Definately not Merced or anything Intel.

> like a bridge to the new platform which will be released later this year

> else. Don't forget that Gateway has only made intel boxes and never even
seen a PPC.

Gateway wouldn't pay $40 mill for a virtually dead platform with only a
small user base and then spend money on redevelopment to sell rebadged
PC's. Who'd buy them ?, Amigans certailny wouldn't and neither would Joe
Blow.

>
> Basicly it's a completely new computer and OS with the Amiga name on it.
It's like
> buying a PC whith the Commodore sign on it. It has got nothing at all to
do with
> Commodore.

It's for real dude, and it's an Amiga and it's not a PC.
I can't see a PC being 5-10X faster then the current PII by end 1999.

Besides, what the hell is the problem with having another alternative to
Intel ?.

Sour grapes ?
:-)

Regards,

Clockmeister.

The Alpha 21264 is, esp. on the floatingpoint part. Integer specs are a bit less. And this processor is shiping now. It's not some magical vapor ware like Intel Merced or a 'quantum processor' to be released in 1999. It is simply the fastest processor available.

Bye, Hans

And it's not a Amiga.

> I can't see a PC being 5-10X faster then the current PII by end 1999.

5-10x times faster than what? A sluggish 266MHz P2, or a 400MHz? I wonder
how they define "todays PCs"?

And which is this mysterious CPU?

> Besides, what the hell is the problem with having another alternative to
> Intel ?.

Nothing! Did you say that?

> Sour grapes ?

For what? I think you have missed something obvious and the funny thing is that you doesn't even know it.

The current Alpha (available since last year) is 4-7 times as fast
as a P2. Next one out next year will be between 8-15 times as fast.

I would just like to know what is the point of all this discussion of an Amiga in an Atari ng.
Falcon030, 14mb ram, 540mb hd, 17" svga monitor, MagiC, Pagestream, NVDI, ExtedDos Pro, ICD HD utilities.

     You could wire a buncha Ameoba's and Falcon's together
     and rerender all of D2's digital effects for Titanic.

Titanic was officially render on Alphas running Linux.
Amiga can probably do that, they did an great job in babylon 5, but the Titanic team decided to use Alpha/Linux combination.

Subject: TAF MonSTEr Flea Market July 11th - update!
Date: 1998/07/04
Message-ID: <359d8abd.0@diana.idirect.com>#1/1
X-Deja-AN: 368557030
Organization: Keeping Atari Flame Alive
Newsgroups: comp.sys.atari.advocacy

SATURDAY, JULY 11TH, 1998 is the date for the Toronto Atari Federation FLEA MARKET! The doors open to the public at 1:00 PM and will remain open until 5:00 PM.

This may be your 'last chance' to come to a bazaar of Atari related pre-owned hardware and software where you may find that peripheral, application or utility for your ST/Mega/TT/Falcon 16/32-bit computer system or your XL/XE 8-bit classic computer system.

Not only is this an opportunity to buy or sell hard- ware and software for TAF members and other Atarians, this will also be an event whereby you can learn what you can still do with an Atari, including the Internet, Desktop Publishing, Scanning OCR, MIDI, and much, much, more! There is a confirmed Internet Demo by Dan Dreibelbis (using the suite of available Internet prgs. running under STiNG), Howard Carson of MGI will be showing Calamus SL-98, Martin Neuland will do a demo of Logic 2.5, and Darek Michoka of Emulators Inc. will be offering his latest version of his GEMulator Atari emulation program for the PC .

If you have original software or hardware that you no longer have any use for, get yourself a half-table and try to sell it! Or find that treasure that you have always wanted. Great deals should be in abundance.

We are anticipating a good turnout and hoping to have some dealers at this event and thus TAF has booked a larger hall to accomadate everyone. To help defray some of TAF's costs of the event, the following will apply:

Half-Table's will be $5.00 or the Full-Table for $10.00 each. Half-Table's are FREE to TAF MEMBERS. Admision is $2.00 per non-member family but if you are selling and have taken a half-table or more, admission is included. Admission for TAF members is, of course, Free.

The Flea Market will run from 1:00 PM to 5:00 PM, with setup commencing for sellors after 12:00 PM, noon, and teardown after 5:00 PM. This should allow enough time for as many people inside and outside Toronto to attend the event.

As usual, piracy cannot and will not be condoned. You must be selling original pre-owned software only. If anyone is caught selling pirated software or stolen hardware, they will be dealt with severely!!

The TORONTO ATARI FEDERATION Flea Market will be held in the "Gold Room" of the North York Memorial Community Hall on the Lower or Concourse Level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkhome Ave. Parkhome is 5 stoplights North of Hwy 401 running East off of Yonge.

Parking garage inside the complex - enter next to the Novotel Hotel on Parkhome Ave. Those comming by public transport can take the TTC's Yonge Subway, North to the North York City Centre Station, then walk through the tunnel into the concourse, down to the food court, turn left and find the Memorial Hall on your right.

Saturday, July 11, 1998, 1pm - 5pm for the TAF "Flea Market. To contact TAF on booking a table or tables:
